Letter from Banner Leadership

At Banner we're deeply committed to our mission, *making health care easier so life can be better.* We serve unique communities, from rural towns to large metropolitan areas, supporting our community members through all stages of life. Our wide array of services do just that, including acute care, employed physician groups, outpatient surgery centers, urgent care locations, retail pharmacies, imaging centers, physical therapy, behavioral health services, academics, research, home health, and health insurance plans.

Banner recently completed the fifth cycle of our Community Health Needs Assessments (CHNA) across the six states we serve. In partnership with local community health departments, we engaged with community members to identify areas of need. The completion of this report is three-years in the making.

Through engagement with the community during our CHNA process, we reviewed the changing needs and social determinants of health for the underserved—seeking input from target populations with greater health care needs such as children, women and the elderly.

This health needs assessment will guide the ways in which Banner continues promoting health and wellness in the communities we serve.

Following the completion of the CHNA reports, Banner Health will develop Implementation Plans to address the identified priority health needs for the communities we serve. The Implementation Plans will provide a framework for Banner Health to continue to support our communities in their health journeys.

We would like to recognize and thank our partners for their collaboration in the CHNA process. Your support has helped us optimize care in more places, improving the health of the communities we serve.

Amy Perry

President and CEO

Banner Health

Executive Summary

Headquartered in Phoenix, AZ, Banner Health is one of the nation's largest nonprofit health care systems and is guided by our nonprofit mission: *Making health care easier, so life can be better.* This mission is the cornerstone of operations at all our 33 acute care hospitals as well as in our health centers and clinics. Banner hospitals range from large regional medical centers to small town critical access facilities in Colorado, Wyoming, Arizona, Nebraska, Nevada and California, all serving an incredibly diverse patient population.

The 2025 Community Health Needs Assessment (CHNA) process included insights and input from a range of community members, including public health experts and representatives of underserved populations. This inclusive approach ensures that the assessment reflects diverse perspectives and community experiences. The priorities identified in this report help to guide the hospital's ongoing community health improvement programs and community benefit activities. In addition, this report also complies with federal tax requirements set forth in Internal Revenue Code Section 501(r), requiring hospital facilities owned and operated by an organization described in Internal Revenue Code Section 501(c)(3) to conduct a CHNA at least once every three years.

The 2025 CHNA process was developed and organized by the CHNA Steering Committee, led by the Executive Leader Todd Werner, President of Community Delivery with input and support from Banner's Strategy and Growth Department's Senior Program Director. Additional guidance was provided by the CEO for Banner's Arizona, Western Division, Academic and Rehabilitation Divisions as well as the CEOs from local facilities. In Maricopa County, the Synapse Coalition, with the Maricopa County Department of Public Health (MCDPH), worked together to identify community strengths through a coordinated CHNA. Synapse is a coalition of non-profit and federally qualified health care providers that work together to collect data and conduct CHNAs to guide community investments. The following organizations are a part of the Synapse Coalition:

- Adelante Healthcare
- Banner Health
- City of Hope
- Circle the City
- Dignity Health
- Mayo Clinic
- Native Health
- Neighborhood Outreach Access to Health (NOAH)
- Phoenix Children's
- Valleywise Health
- Vitalyst Health Foundation

This effort was supported by Arizona State University's Southwest Interdisciplinary Research Center (SIRC) in developing and conducting focus groups; the OMNI Institute for conducting key informant interviews; and community-based agencies and healthcare partners to collect community surveys within Maricopa County. Health indicators were compiled and analyzed by MCDPH's Division of Epidemiology and Informatics. Crescendo Consulting Group leveraged data collected via the Synapse coalition to produce the charts, graphs, maps, and narratives that appear in this report.

Overall Methodology

The CHNA methodology involved a 4-stage process which included an environmental analysis, community input, and prioritization as outlined below.

Input was solicited and provided by at least one state, local, tribal, or regional governmental public health department (or equivalent department or agency), or a State Office of Rural Health described in Section 338J of the Public Health Services Act, with knowledge, information, or expertise relevant to the health needs of the community.

Secondary Data

These data points provide critical insights into the demographics of Maricopa County. Topics included indicators for communicable and chronic disease, birth statistics, causes of death, causes for hospitalizations, along with social, behavioral, demographic, and environmental data. The data was collected and analyzed by MCDPH's Division of Epidemiology and Informatics. That team accessed multiple data sources to collect and analyze health indicators at the national, state, and county levels.

Qualitative Research

The OMNI Institute conducted 24 key informant interviews between January and May of 2024. MCDPH also contracted with SIRC who conducted 46 focus groups with 366 participants reaching 15 priority populations during the summer of 2023. Priority populations included representatives of the Asian, Black/African American, Hispanic, Native American, Native Hawaiian/Pacific Islander, youth ages 12-17, older adults ages 65 and older, low-income individuals, religious minorities, unsheltered, disables, veterans, LGBTQ+, refugee / immigrant / migrant

community, formerly incarcerated and people living in rural areas of Maricopa County.

Community Survey

The survey was administered in 14 languages (Arabic, Burmese, Mandarin Chinese, Dari, English, French, Kinyarwanda, Korean, Lao, Navajo, Spanish, Swahili, Thai, and Vietnamese). To increase accessibility, MCDPH provided large-font printed paper surveys, offered verbal surveys taken over the phone through the CARES Line, and partnered with SAAVI Services for the Blind to develop surveys in Unified English Braille. Surveys in languages other than English were translated by fluent language speakers and for analysis, free-text responses were translated back into English.

All survey data was collected between March and June of 2023. A total of 18,297 responses were collected and analyzed. SIRC conducted additional focus groups with a total of 309 participants during the summer of 2023.

Prioritized Needs

The needs prioritization is a critical final step in the Community Health Needs Assessment process. The quantitative and qualitative research results for Maricopa County were presented. A modified Hanlon Method was used to identify the top priorities on which Banner Gateway Medical Center will focus in their 2025-2028 Implementation Strategy. The top three priorities are as follows:

- Access to Mental and Behavioral Health Services
- Cancer Prevention and Treatment
- Obesity and Nutrition

Next Steps: From Analysis to Action

The priorities identified in this report help to guide the hospital's ongoing community health improvement programs and community benefit activities. Per Affordable Care Act (ACA) requirements, each nonprofit hospital must adopt an implementation strategy that describes how the hospital will address the identified significant community health needs. To satisfy this requirement, the CHNA findings and selected priority areas were used to inform our 2025-2028 Hospital Implementation Strategies plan.

This CHNA report was adopted by Banner Health's board in December 2025.

Introduction

The purpose of this Community Health Needs Assessment (CHNA) is to identify and prioritize significant health needs of the community served by Banner Gateway Medical Center (BGMC), Gilbert. The priorities identified in this report help to guide the hospital's ongoing community health improvement programs and community benefit activities. This CHNA report meets the requirements of the Affordable Care Act (ACA) that nonprofit hospitals conduct a CHNA at least once every three years. BGMC- Gilbert is dedicated to enhancing the health of the communities it serves. The findings from this CHNA report serve as a foundation for understanding the health needs found in the community and will inform the implementation strategies selected. This report complies with federal tax requirements set forth in Internal Revenue Code Section 501(r), requiring hospital facilities owned and operated by an organization described in Internal Revenue Code Section 501(c)(3) to conduct a CHNA at least once every three years. Regarding the CHNA, the ACA specifically requires nonprofit hospitals to:

1. Collect and take into account input from public health experts, community leaders, and representatives of high need populations – this includes minority groups, low-income individuals, medically underserved populations, and those with chronic conditions;
2. Identify and prioritize community health needs;
3. Document a separate CHNA for each individual hospital; and,
4. Make the CHNA report widely available to the public.

In addition, each nonprofit hospital must adopt an implementation strategy that describes how the hospital will address the identified significant community health needs. This is the fifth cycle for Banner Health, with the fourth cycle completed in 2022. Feedback on the previous CHNA and Implementation Strategy will be addressed later in the report. This CHNA report was adopted by Banner Health's board in December 2025.

This report is widely available to the public on the hospital's website https://www.bannerhealth.com/staying-well/community/health-needs-assessments-report.

Please use the following link to either submit written comments on these reports and / or request paper copies: CHNA.CommunityFeedback@bannerhealth.com.

About Community Health Needs Assessments

The Community Health Needs Assessment (CHNA) is a comprehensive process that identifies the health needs, barriers to accessing care, and the social drivers of health (SDoH) in a community. Intentional outreach was made to include the voices and lived experiences of the community members that may not have historically participated in this process in prior years. The Community Health Needs Assessment is also a requirement of all non-profit hospitals to complete every three years as part of the Patient Protection and Affordable Care Act (the ACA) and codified under IRS Section 501(r)(3). After a CHNA, hospitals must also complete a three-year Implementation Strategy Plan (ISP) that identifies how the hospital plans to address identified prioritized needs of the community.

About Banner Health

Headquartered in Phoenix, AZ, Banner Health is one of the nation's largest nonprofit health care systems and is guided by our nonprofit mission: Making health care easier, so life can be better. This mission is the cornerstone of operations at our 33 hospitals and clinics, ranging from large regional medical centers to small town critical access facilities in Colorado, Wyoming, Arizona, Nebraska, Nevada and California, all serving an incredibly diverse patient population. Banner provides more than $1B annually in community benefit and charity care—treatment without expectation of being paid. As a nonprofit organization, we reinvest revenues to add new hospital beds, enhance patient care and support services, expand treatment technologies as well as maintain equipment and facilities. Furthermore, Banner subsidizes medical education costs for hundreds of physicians in our residency training programs in Arizona (Phoenix, Tucson, Payson) and Colorado (Greeley).

With organizational oversight from a 13-member board of directors and guidance from both clinical and non-clinical system and facility leaders, more than 55,000 employees work tirelessly to provide excellent care to patients in Banner's acute care hospitals, rehabilitation hospitals, urgent cares, clinics, surgery centers, home care, telehealth and other care settings.

Banner has the experience and expertise to provide primary care, hospital care, outpatient services, imaging services, rehabilitation services, long-term acute care and home care to patients facing virtually any health conditions. In addition, an array of core services and specialized services are also provided such as cancer care, emergency care, heart care, maternity services, neurosciences, orthopedics, pediatrics and surgical care. Specialized services include behavioral health, burn care, high-risk obstetrics, Level 1 Trauma care, organ and bone marrow transplantation and medical toxicology. Our lifesaving air medical transport program brings patients to our centers quickly and compassionately. And our expanded telemedicine offerings ensure everyone has access to the best care. We also participate in a multitude of local, national and global research initiatives, including those spearheaded by researchers at our three Banner – University Medical Centers, Banner Alzheimer's Institute and Banner Sun Health Research Institute.

Ultimately, Banner's unwavering commitment to the health and well-being of its communities has earned accolades from an array of industry organizations. For example, Banner's Supply Chain team was nationally recognized for advancing supply chain diversity in 2024, and in 2024 was among the nation's most trustworthy by *Newsweek*. Banner Alzheimer's Institute has also garnered international recognition for its groundbreaking Alzheimer's Prevention Initiative, brain imaging research and patient care programs. Further, Banner continues to be recognized as one of the Best Places to Work by *Becker's Hospital Review,* has been Great Place to Work certified for two consecutive years, and named in *Newsweek's* Most Trustworthy Companies in America.

About Banner Gateway Medical Center

Banner Gateway Medical Center (BGMC) opened in 2007 as a member of the Banner Health system and sits on a 60-acre campus. BGMC was the first campus in the system to utilize an Electronic Medical Record. A new patient tower was completed in April 2023 which nearly doubled BGMC's square footage, and includes four operating rooms, one angiography suite, one endoscopy room, one c-section operating room, two emergency department rooms, one MRI suite and three ultrasound rooms. The NICU expansion took the unit from eight beds to 16. While the program remains a Level II nursery, the expanded space allows for more support and has inspired local practices to choose BGMC as a delivery location.

BGMC opened their Banner MD Anderson Cancer Center (BMDA) in September of 2011. This partnership includes a cellular therapy lap and a medical imaging program that continues to grow. With two PET/CT imaging modalities, these services increase access for oncology patients. In October 2024 BMDA added a new treatment location. The program opened 6 infusion bays for low acuity infusion needs specifically for BMDA patients at Banner MD Anderson at Canyon Springs medical office building. The project increased treatment appointment access/availability by 10% Monday-Friday and has the ability to increase capacity to 22 bays as patient demand grows over time.

BGMC is committed to providing a wide range of quality care, based on the needs of the community, including the following services:

- Cancer Care (Banner MD Anderson Cancer Center)
- Bariatric Surgery
- Endoscopy
- Medical Imaging
- Intensive Care
- Maternity Services
- Rehabilitation Services
- Surgical Care
- Advanced Neonatal Care

BGMC's accolades include being named a CMS 4 Star Facility (official public release April – July) in 2025. In 2024, BGMC earned an ED Pediatric Prepared Care Facility Redesignation, a Leapfrog Safety Grade – B and a Foundation for the Accreditation of Cellular Therapies (FACT) Stem Cell Transplant Cellular Therapy Program Redesignation. In 2003, BGMC earned an American College of Radiology Reaccreditation in All Outpatient Modalities, a Diagnostic Imaging Center of Excellence Redesignation and a MAGNET Redesignation and an American College of Surgeons Metabolic and Bariatric Accreditation-Diamond certification (ACS) Surgical Quality Partner. BGMC also earned an American Society of Health-System

Pharmacists Re-Accreditation of Post-Graduate Two-Year Pharmacy Residency in 2022.

BGMC's commitment to the community is laudable. Every year the Banner Gateway Women and Infants Services' Shared Leadership committee hosts well attended community celebrations such as a Fall Festival, Easter Egg Hunt and special reunions for NICU families for the babies born at BGMC.

In 2024, BGMC employed 1,991 team members who were supported by 738 volunteers, who gave 74,693 hours of their time.

Description of Community Served

BGMC serves patients in the East Valley of metropolitan Phoenix, including the communities of Gilbert, Queen Creek, Chandler, and Mesa, in Maricopa County, Arizona.

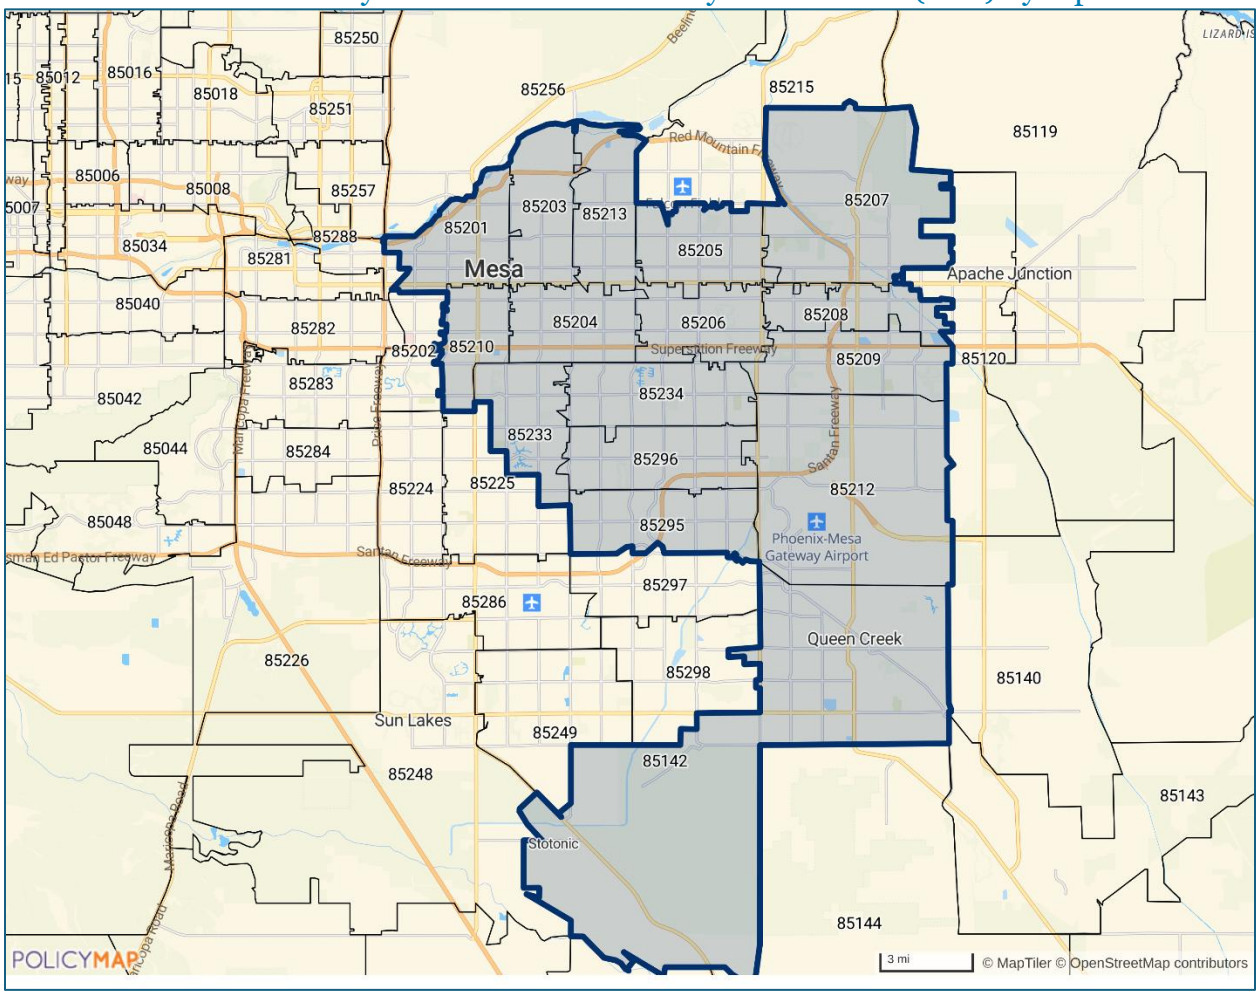
Maricopa County is the fourth most populous county in the United States. With an estimated population of four million and growing, Maricopa County is home to well over half of Arizona's residents. Maricopa County encompasses 9,224 square miles, includes 27 cities and towns, as well as the whole or part of five sovereign American Indian reservations. The demographic area for this CHNA is Maricopa County, the common community for all partners participating in the SYNAPSE coalition collaborative.

The demographic area for this CHNA is Maricopa County, the common community for all partners participating in the Synapse Coalition collaborative. However, primary service area (PSA) information for BGMC will also be provided when available. BGMC's PSA includes the zip codes making up the top 75% of the total inpatient cases. The PSA includes all residents in a defined geographic area surrounding the hospital and does not exclude low-income or underserved populations.

The following map (Exhibit 1) depicts BGMC's origins by zip code identified through BGMC discharge data.

Facility Inpatient Origin by Zip Code Map

Exhibit 1: Banner Gateway Medical Center Primary Service Area (PSA) by Zip Code



CHNA Collaborators and Methods

Maricopa County health centers and hospitals play a vital role in enhancing the region's health and economy. Beyond providing high-quality medical care, these institutions implement programs that address community-specific needs. Many healthcare partners serve overlapping populations, leading to collaboration through the Synapse Coalition. The Synapse Coalition, with the Maricopa County Department of Public Health (MCDPH), work together to identify community strengths and address the most pressing needs through a coordinated CHNA. Synapse is a coalition of non-profit and federally qualified health care providers that work together to collect data and conduct CHNAs to guide community investments. The following organizations are a part of the Synapse Coalition:

- Adelante Healthcare
- Banner Health
- City of Hope
- Circle the City
- Dignity Health
- Mayo Clinic
- Native Health
- Neighborhood Outreach Access to Health (NOAH)
- Phoenix Children's
- Valleywise Health
- Vitalyst Health Foundation

This effort was supported by Arizona State University's Southwest Interdisciplinary Research Center (SIRC) in developing and conducting focus groups; the OMNI Institute for conducting key informant interviews; and community-based agencies and healthcare partners to collect community surveys within Maricopa County. Health indicators were compiled and analyzed by MCDPH's Division of Epidemiology and Informatics. Crescendo Consulting Group leveraged data collected via the Synapse coalition to produce the charts, graphs, maps, and narratives that appear in this report.

This mixed-methods approach leverages a combination of primary and secondary quantitative and qualitative research methods designed to evaluate the perspectives and opinions from a wide variety of community stakeholders.

Each activity is described below in more detail.

Secondary Data

These data points provide a critical insight into the demographics of Maricopa County. Topics included indicators for communicable and chronic disease, birth statistics, causes of death, causes for hospitalizations, along with social, behavioral, demographic, and environmental data. The data was collected and analyzed by MCDPH's Division of Epidemiology and Informatics. That team accessed multiple data sources to collect and analyze health indicators at the national, state, and county levels.

Qualitative Research

The OMNI Institute conducted 24 key informant interviews between January and May of 2024. MCDPH also contracted with SIRC who conducted 46 focus groups with 366 participants reaching 15 priority populations during the summer of 2023. Priority populations included representatives of the Asian, Black/African American, Hispanic, Native American, Native Hawaiian/Pacific Islander, youth ages 12-17, older adults ages 65 and older, low-income individuals, religious minorities, unsheltered, disables, veterans, LGBTQ+, refugee / immigrant / migrant community, formerly incarcerated and people living in rural areas of Maricopa County.

Community Survey

The survey was originally developed by the National Association of County and City Health Officials (NACCHO) and modified by MCDPH, Synapse Coalition, and the Health Improvement Partnership of Maricopa County (HIPMC) partners. The electronic version of the survey was developed in Alchemer© and paper-based surveys were provided upon request and distributed at community events and through community-based organizations. Results from paper-based surveys were entered into Alchemer© by trained data entry specialists. The survey was administered in 14 languages (Arabic, Burmese, Mandarin Chinese, Dari, English, French, Kinyarwanda, Korean, Lao, Navajo, Spanish, Swahili, Thai, and Vietnamese). To increase accessibility, MCDPH provided large-font printed paper surveys, offered verbal surveys taken over the phone through the CARES Line, and partnered with SAAVI Services for the Blind to develop surveys in Unified English

Braille. Surveys in languages other than English were translated by fluent language speakers and for analysis, free-text responses were translated back into English.

All survey data was collected between March and June of 2023. A total of 18,297 responses were collected and analyzed. SIRC conducted additional surveys at the commencement of each focus group, with a total of 309 survey participants during the summer of 2023.

Data Limitations

Secondary data sources are often large-scale efforts that take time to collect, clean, and analyze data prior to publication. Due to the time required between data collection and publication, many of these sources publish data collected up to 18 to 24 months before publication. Therefore, while this report was published in 2025, many data sources cited herein are dated in prior years. Data available from rural areas can also be limited due to small numbers.

Qualitative data collection efforts can be affected by the rurality in the regions where data collection efforts were conducted. Participation is also often limited to those who choose to or can engage, which may not reflect the experiences of everyone in a community.

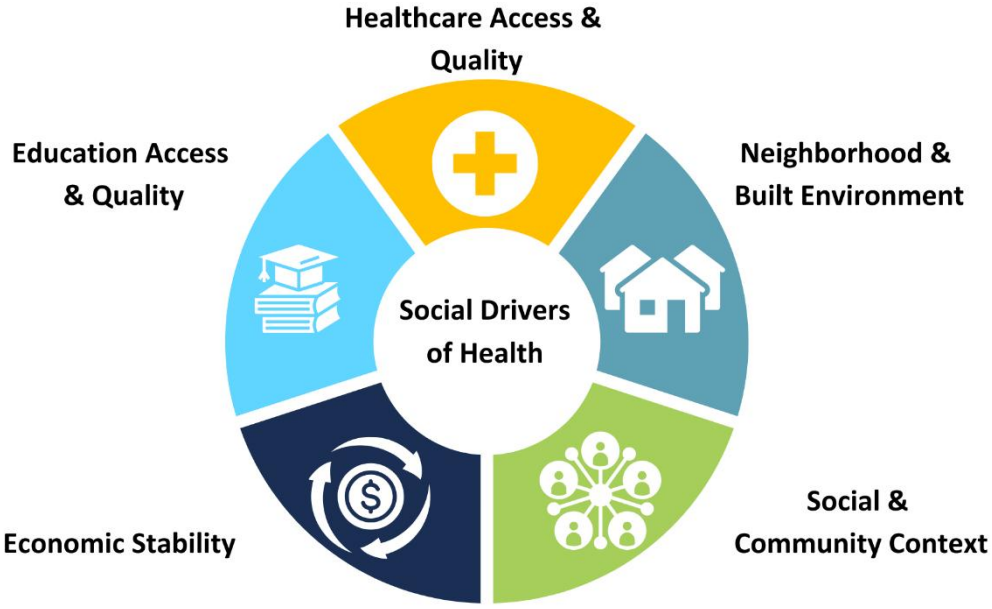
Not all survey respondents provided demographic information, and not all survey respondents answered each question.

Social Drivers of Health

The social drivers of health (SDoH), also called social determinants of health, are the conditions in the environments where people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks.[1] Clinical care impacts only 20.0% of health outcomes, while social drivers impact as much as 50.0% of health outcomes.[2] Examples of SDoH include economic stability, safe and affordable housing, access to nutritious foods, and many more. The social drivers of health model consists of five domains shown below in Exhibit 2. This framework is included to highlight the broader social and environmental conditions that influence health and can provide useful context when considering the findings in this report.

[1] ODPHP, n.d. Social Determinants of Health.
[2] Whitman et al. (ASPE), 2022.

Exhibit 2: Social Drivers of Health Framework



Healthy People 2030

Healthy People 2030 sets data-driven national objectives to improve health and well-being of communities across the United States over the next decade. The federal initiative is managed by the U.S. Department of Health and Human Services Office of Disease Prevention and Health Promotion. The identified needs of the CHNA use similar language to the Healthy People 2030 objectives and indicators. For more information about Healthy People 2030, please visit https://odphp.health.gov/healthypeople.[3]

[3] ODPHP, n.d. Social Determinants of Health.

Overview of Needs Prioritization Process

On July 31, 2025, 10 participants from Banner Gateway Medical Center leadership came together to prioritize the most significant health needs for their region.

The needs prioritization is a critical final step in the Community Health Needs Assessment process. The quantitative and qualitative research results for Maricopa County were presented. A modified Hanlon Method was used to identify the top priorities on which Banner Gateway Medical Center will focus in their 2025-2028 Implementation Strategy. A complete description of this process is provided on page 67. A list of those needs appears in the following section.

List of Prioritized Needs

- Access to Mental and Behavioral Health Services
- Cancer Prevention and Treatment
- Obesity and Nutrition

Needs Assessment Findings

The following sections outline the findings that surfaced during the formative research. These findings were used during the needs prioritization process.

The following findings provide a snapshot of health needs within the hospital's PSA. All data in this section was collected and analyzed by the Synapse Coalition.

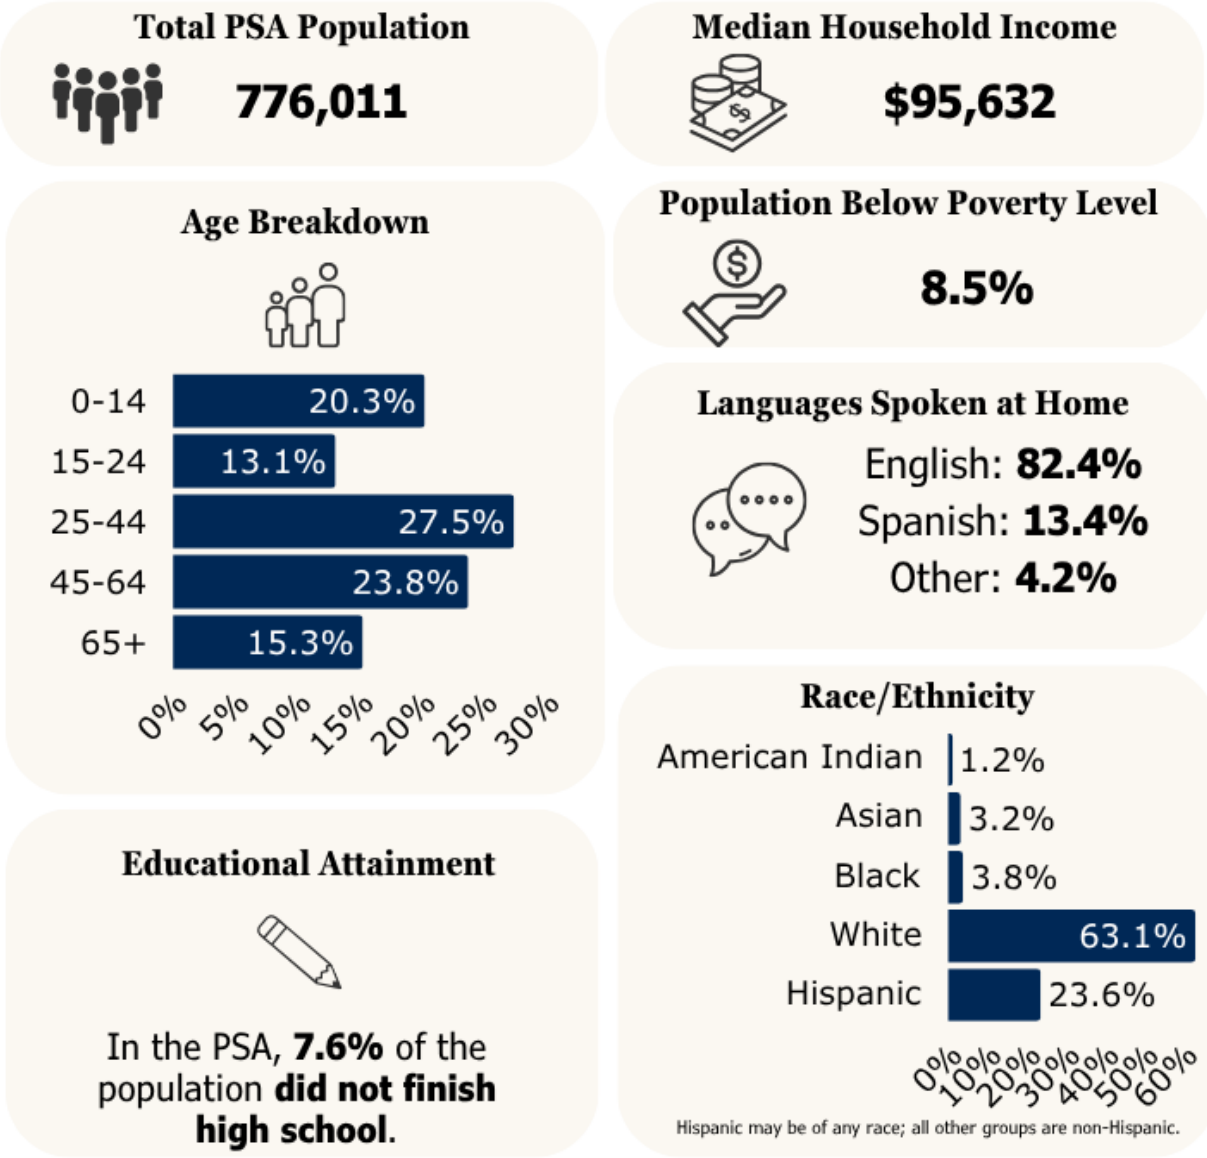
Most of the secondary data reflects conditions within the PSA. When PSA-level data is not available or when broader comparisons are helpful, data for Maricopa County or the state of Arizona is included and clearly noted.

Community survey data was collected across Maricopa County and analyzed by region. This report includes only the survey results from the region or regions that align with the PSA. The prioritized needs are then identified in the Prioritized Needs section.

Secondary Data Findings

Demographics

Understanding the makeup of the population is an important first step in identifying community health needs. Demographic data provides context about who lives in the area and helps highlight differences in health outcomes across groups. It also sheds light on the underlying factors that shape access to care, social and economic opportunity, and overall well-being.



Source: U.S. Census Bureau American Community Survey 2019-2023 Five-year Estimates

Health Behaviors and Risk Factors

This section includes information on how Maricopa County residents view their overall health, the choices they make that influence it, and risk factors that may increase the chance of illness or disease.

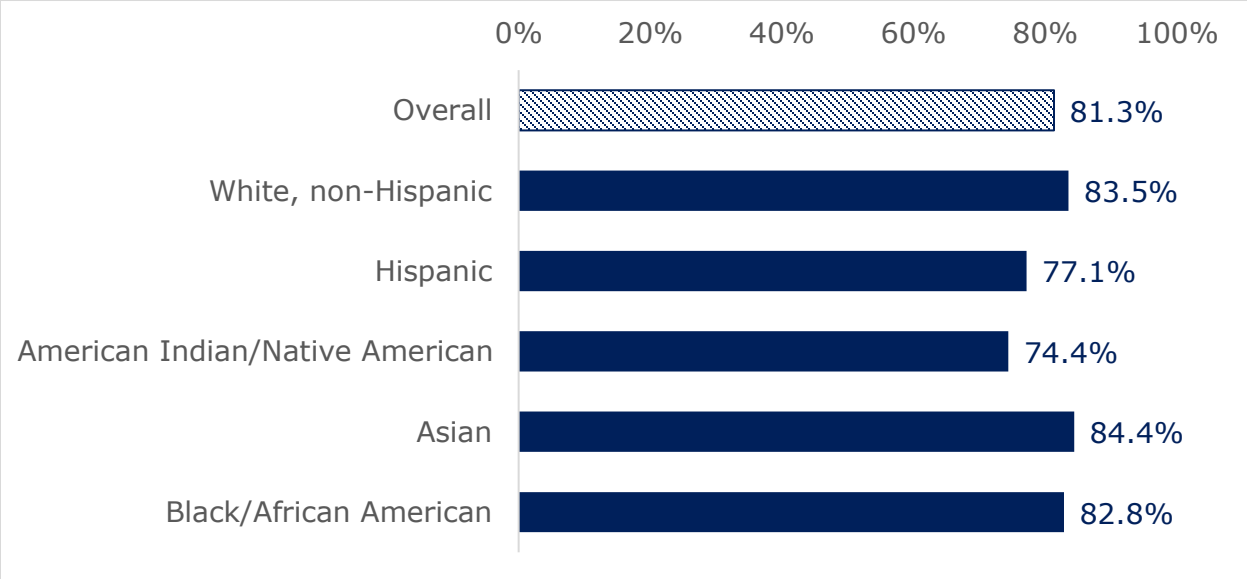
Self-rated health is widely used in public health research because it has been shown to predict outcomes such as hospitalization, disease incidence, and mortality.[4]

As seen in Exhibit 3, in 2022, 81.3% of Maricopa County adults self-reported their health as excellent, very good, or good. While this countywide average is relatively high, differences across racial and ethnic groups are clear.

- Asian (84.4%) and White, non-Hispanic (83.5%) residents had the highest rates of positive self-rated health.
- Black/African American residents followed closely at 82.8%.
- Hispanic (77.1%) and American Indian/Native American (74.4%) residents were less likely to report good or better health.

These differences hint at patterns across Maricopa County, where the conditions that support good health aren't available to everyone in the same way.

Exhibit 3: Self-Rated Health Status (Excellent, Good, Very Good), 2022 (Maricopa County)



Source: Behavioral Risk Factor Surveillance System, 2022, Maricopa County

[4] CDC, 2024. Health Status.

To better understand what might be shaping how people view their own health, it helps to look at behaviors that influence long-term well-being.

Health behaviors like smoking and alcohol use are important indicators of community health. They contribute to long-term outcomes such as heart disease, cancer, and other chronic conditions.[5]

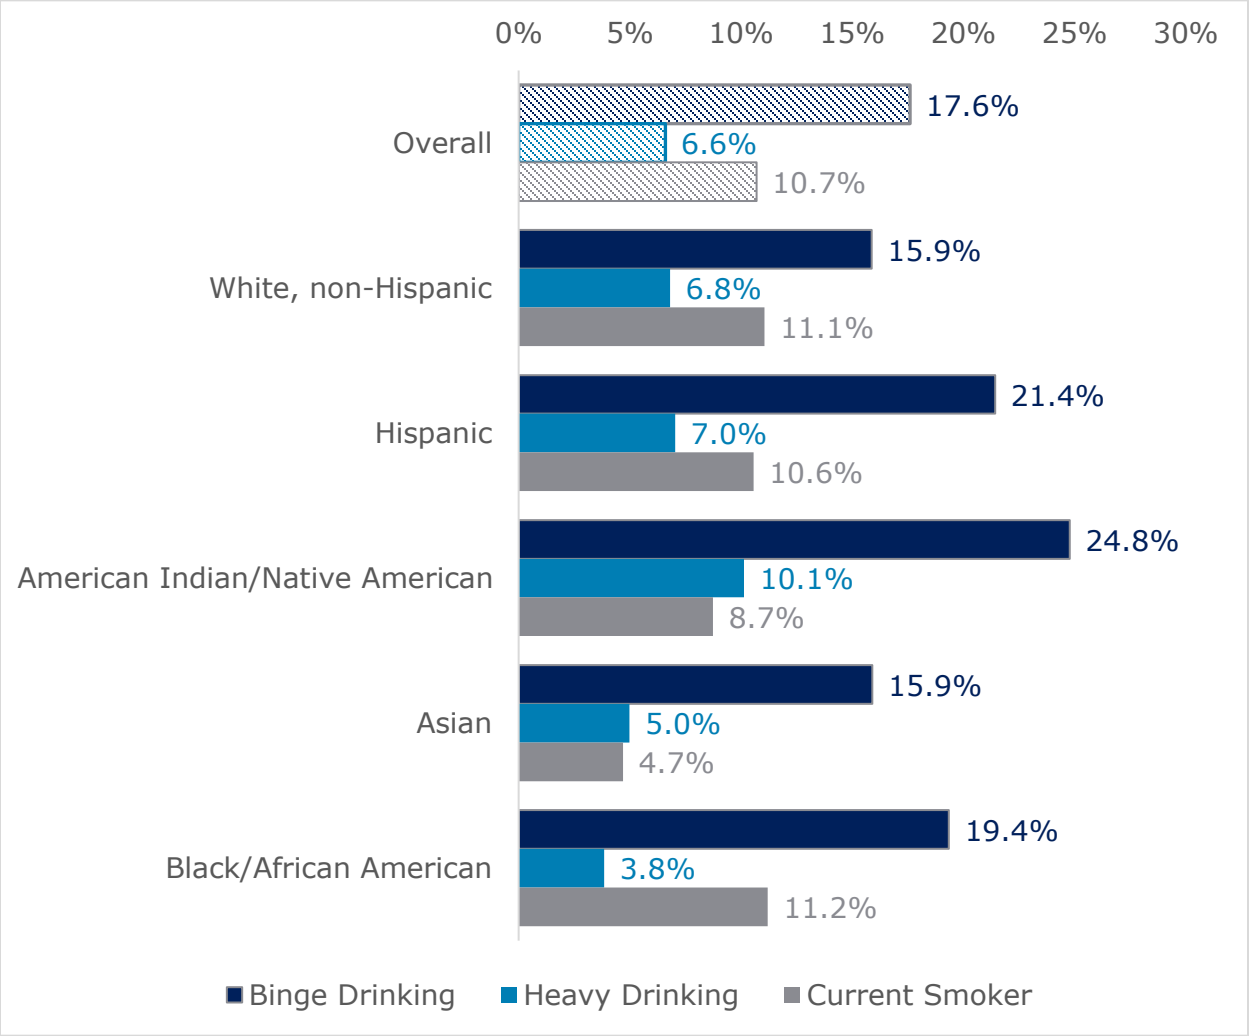
As seen in Exhibit 4, in 2022, 17.6% of adults in Maricopa County reported engaging in binge drinking, 6.6% reported heavy drinking, and 10.7% were current smokers. These behaviors varied by race and ethnicity:

- American Indian/Native American adults had the highest reported rates across the binge drinking (24.8%) and heavy drinking (10.1%) categories.
- Hispanic adults also reported elevated rates of binge drinking (21.4%).
- Asian and Black/African American adults reported the lowest rates of heavy drinking and binge drinking.
- Smoking rates were higher among Black/African American adults (11.2%) and White, non-Hispanic adults (11.1%).

These differences may reflect varying access to resources that support healthier choices, such as tobacco-free environments, substance use prevention efforts, and culturally relevant health education.

[5] CDC, 2024. About Chronic Diseases: Risk Factors.

Exhibit 4: Health Behaviors, 2022 (Maricopa County)



Source: Behavioral Risk Factor Surveillance System, 2022, Maricopa County

After looking at behaviors like smoking and drinking, it's also important to consider daily habits that influence long-term health, including physical activity, nutrition, and weight. These factors are also closely tied to the risk of developing chronic diseases such as diabetes, heart disease, and certain cancers.[6]

As seen in

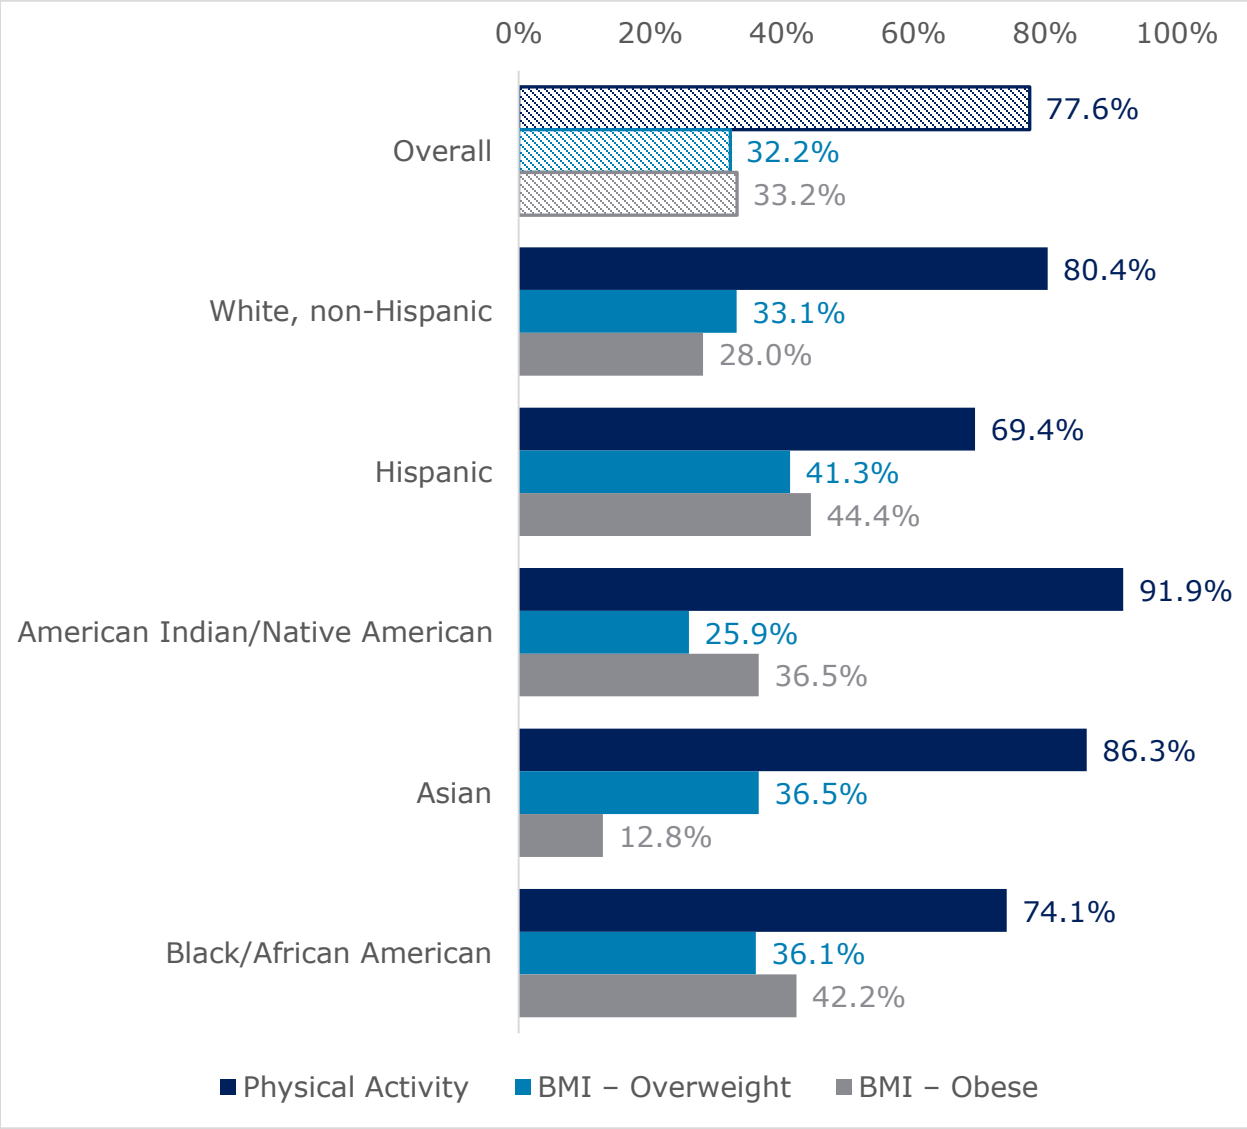
[6] CDC, 2024. Nutrition, Physical Activity, and Weight Status.

Exhibit 5 on the next page, in 2022, 77.6% of Maricopa County adults reported getting some form of physical activity in the past month. However, activity levels and weight status varied by race and ethnicity:

- White, non-Hispanic (80.4%) and Asian (86.3%) adults were the most likely to report being physically active.
- Hispanic adults (69.4%) had the lowest rate of reported physical activity.
- Obesity rates were highest among Black/African American (42.2%), Hispanic (44.4%), and American Indian/Native American (36.5%) adults.
- Asian adults (12.8%) had the lowest obesity rate and were also the least likely to be overweight.

These differences may reflect unequal access to resources that support healthy habits, such as affordable nutritious food, safe outdoor spaces, and consistent preventive care.

Exhibit 5: Chronic Disease-Related Risk Factors, 2022, by Race/Ethnicity (Maricopa County)[7]



Source: Behavioral Risk Factor Surveillance System, 2022, Maricopa County

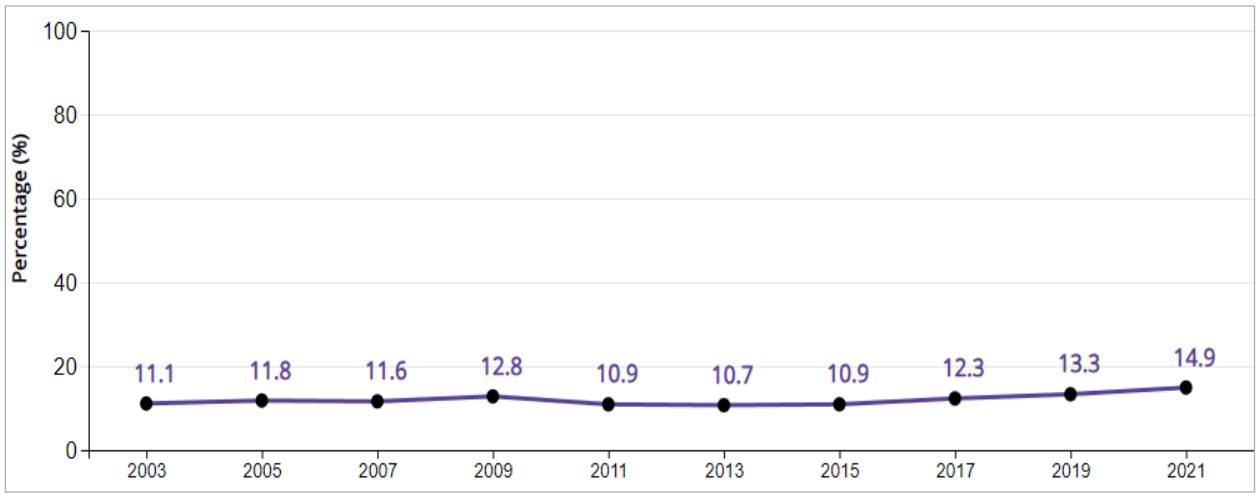
[7] "Physical activity" reflects the percentage of adults who reported participating in any physical activity during the past month. Higher percentages indicate more widespread activity.

It's also important to understand how health risks show up earlier in life. Looking at youth trends can provide insight into future health challenges and help shape prevention strategies.

As seen in Exhibit 6, in 2021, 14.9% of Arizona high school students had obesity, the highest level reported since at least 2003. The increase in 2021 represents a notable shift after obesity rates remained relatively steady for more than a decade.

Obesity in childhood and adolescence increases the risk of developing chronic health conditions like type 2 diabetes, high blood pressure, and joint problems. It can also affect mental health and social development.[8]

Exhibit 6: Prevalence of High School Students Who Had Obesity, 2021 (Arizona)



Source: Youth Risk Behavior Surveillance (YRBS), 2021, Arizona

[8] CDC, 2022. Consequences of Obesity.

Health Outcomes

This section reflects the leading causes of hospitalizations, emergency department visits, and death in the community. Together, they offer a snapshot of the most common and serious health challenges affecting residents.

Understanding which conditions lead to hospital visits or early death helps paint a broader picture of health in the region. These outcomes are shaped by many factors, some clinical and some social, and they tell us what types of conditions are most frequently driving people in the PSA to seek care.

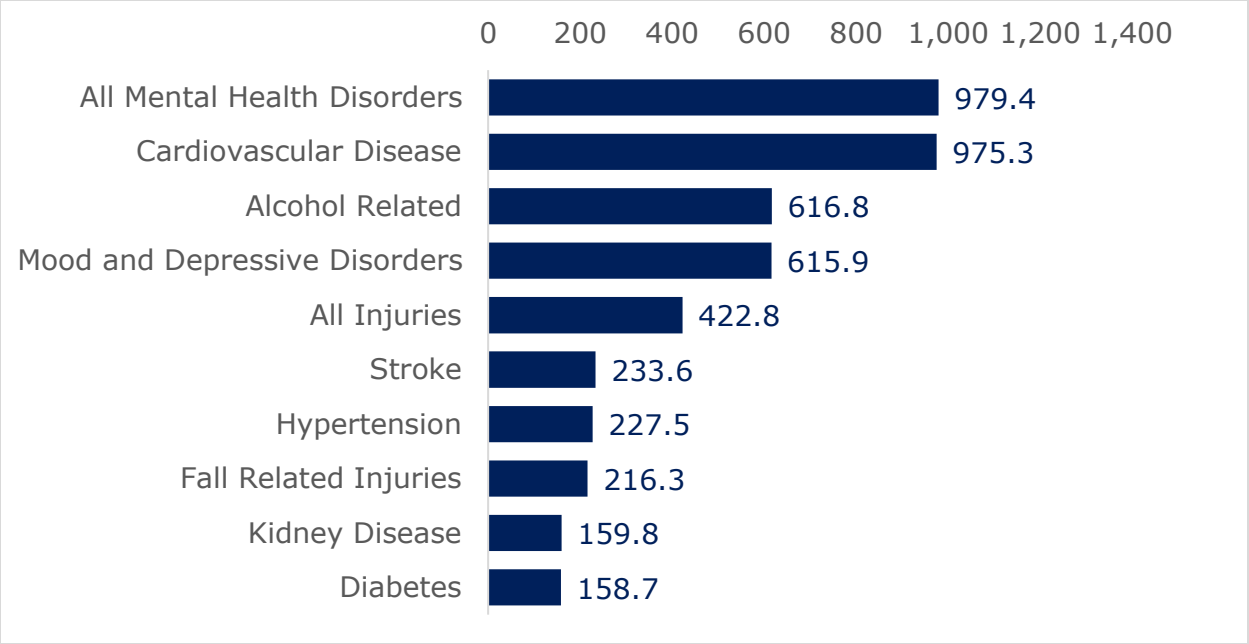
As seen in

Exhibit 7, the top causes of inpatient hospitalizations include mental health conditions, cardiovascular disease, and alcohol-related issues.

Mental health disorders had the highest rate of inpatient stays, at just under 1,000 per 100,000 people. Cardiovascular disease was close behind. Mood and depressive disorders, as well as hospitalizations tied to alcohol use, also made up a large portion of inpatient visits.

Injuries, strokes, and chronic conditions like hypertension, kidney disease, and diabetes appeared further down the list, contributing to the broader demand for hospital-based care.

Exhibit 7: Top Causes of Inpatient Hospitalizations, 2023 Overall Rates per 100,000 (PSA)



Source: Hospital Discharge Data and Death Data, obtained from ADHS, cleaned and analyzed by MCDPH

Inpatient hospitalizations offer one view of health needs that require extended or planned care. Exhibit 8 provides another part of the picture by showing the most common reasons people visit the emergency department, often for more immediate or urgent concerns.

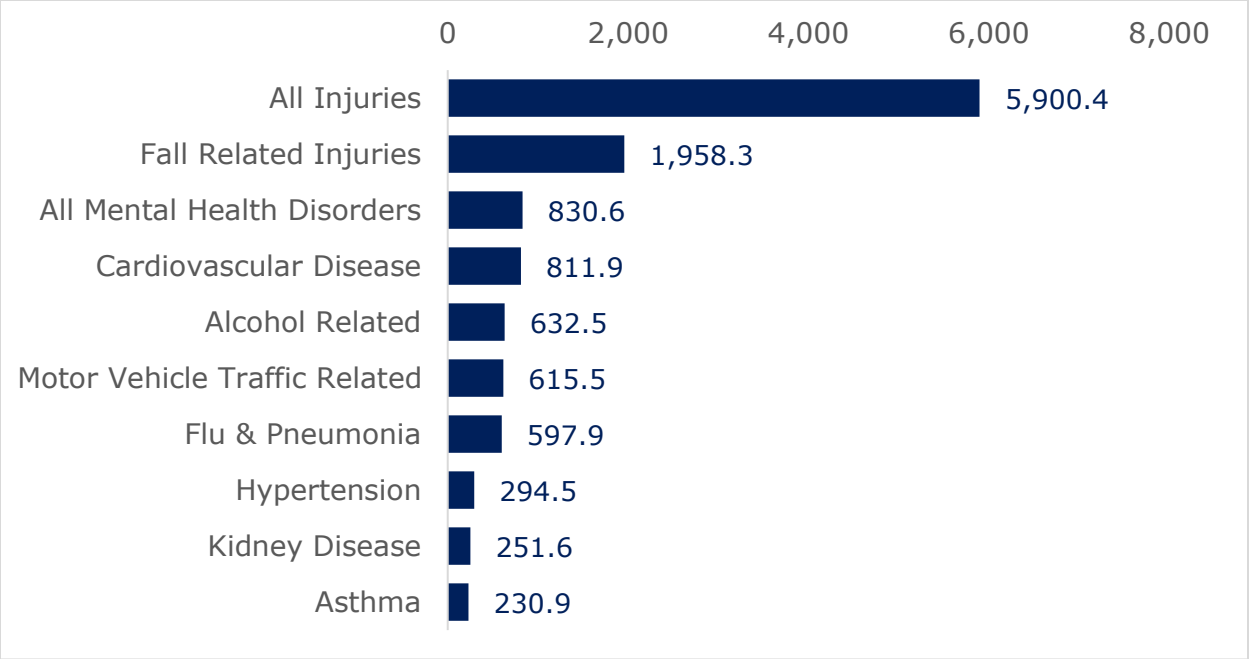
The top reasons for ED visits in the PSA include injuries, behavioral health concerns, and chronic disease.

Injuries were the most common reason people visited the ED, with nearly 6,000 visits per 100,000 residents. About one in three of those were related to falls.

Mental health conditions and cardiovascular disease each contributed over 800 visits per 100,000. Alcohol-related issues, motor vehicle crashes, and respiratory infections like flu and pneumonia also appeared high on the list.

Chronic conditions such as hypertension, kidney disease, and asthma made up a smaller but still notable share. The variety of causes highlights the range of both urgent and ongoing health concerns bringing people to the ED for care.

Exhibit 8: Top Causes of Emergency Department Visits, 2023 Overall Rates per 100,000 (PSA)



Source: Hospital Discharge Data and Death Data, obtained from ADHS, cleaned and analyzed by MCDPH

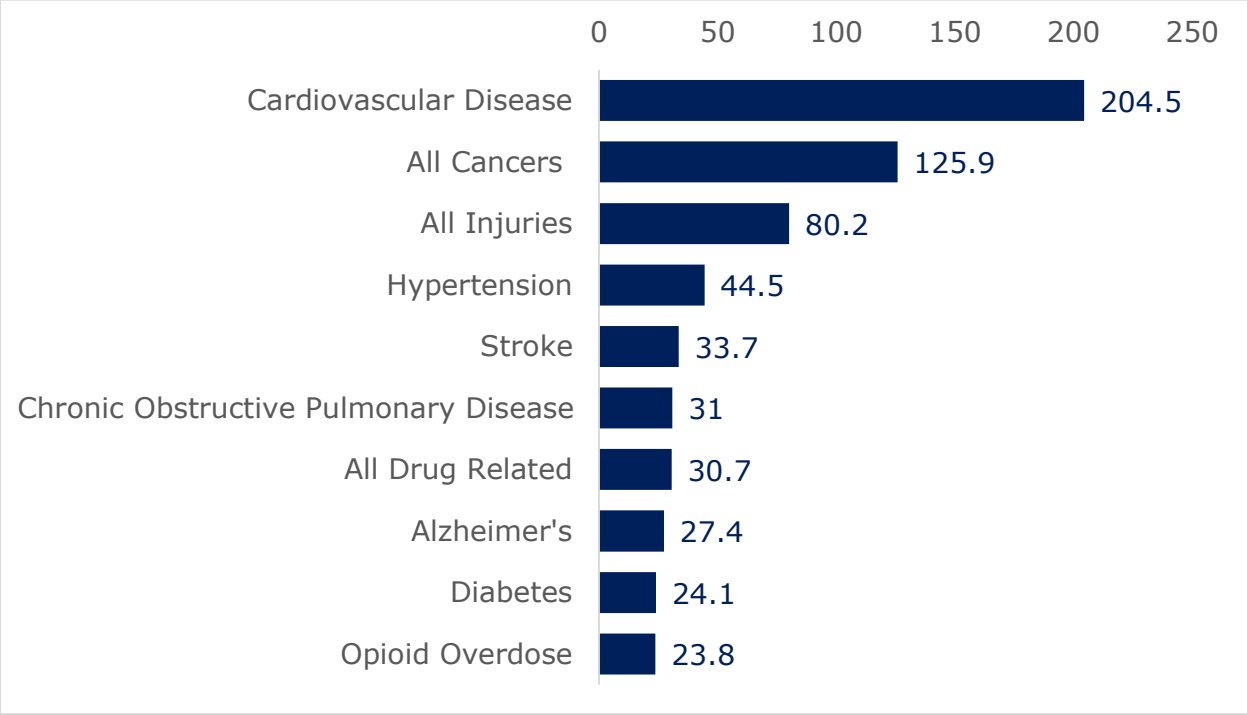
While emergency department data helps highlight urgent health needs, mortality data offers a broader view of the conditions most commonly contributing to death in the region.

Exhibit 9 shows the leading causes of death in the region, adding another layer to understanding of community health. The top causes include cardiovascular disease, cancer, and injuries.

Cardiovascular disease was the leading cause of death, with a rate of 204.5 deaths per 100,000 people. Cancer followed, with about 126 deaths per 100,000. Together, they accounted for a large portion of total deaths in the region.

Injuries ranked third, followed by chronic and progressive conditions like hypertension, stroke, and COPD. Deaths linked to drug use, including opioids, appeared in the bottom half of the list, along with Alzheimer's disease and diabetes. These patterns show a combination of long-term illness and acute events shaping the PSA's overall burden of death.

Exhibit 9: Top Causes of Death, 2023 Overall Rates per 100,000 (PSA)



Source: Hospital Discharge Data and Death Data, obtained from ADHS, cleaned and analyzed by MCDPH

Healthcare Access and Utilization

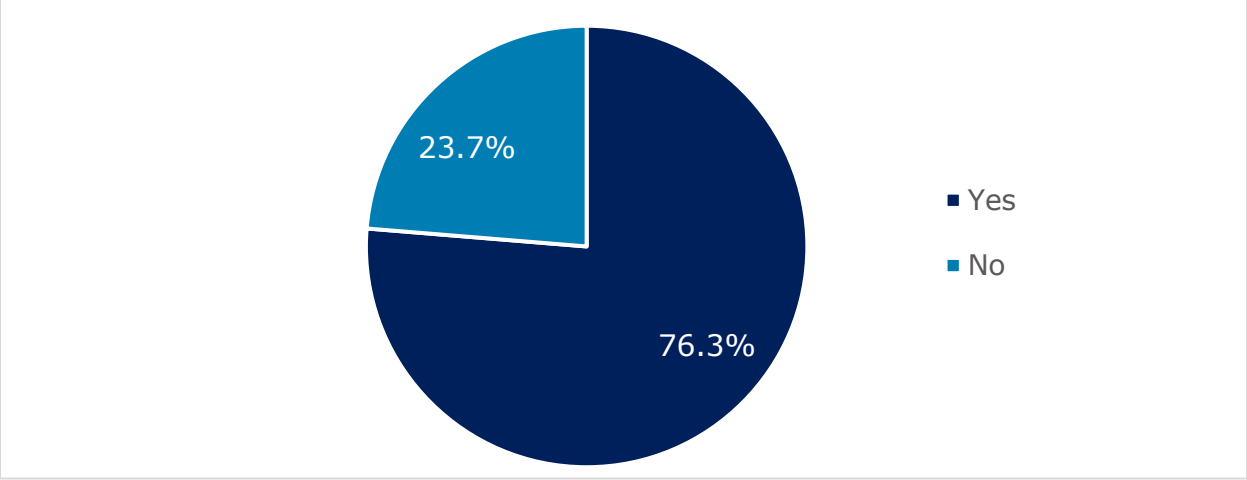
This section explores whether people have regular access to care and how often they use healthcare services. It includes information on insurance coverage, usual sources of care, and patterns in hospital visits by payer type.

Having a usual source of care, such as a regular doctor, clinic, or health center, can make it easier for people to manage chronic conditions, stay up to date on preventive services, and get help when new health issues come up.[9]

As seen in Exhibit 10, in 2022, 76.3% of Maricopa County adults reported having a usual source of care, while 23.7% said they did not. This means nearly one in four adults in the county may be navigating the healthcare system without a consistent care team.

Lacking a usual source of care can create delays in treatment, reduce access to preventive care, and increase the likelihood of using emergency departments for non-emergency issues.[10]

Exhibit 10: People with a Usual Source of Care, 2022 (Maricopa County)



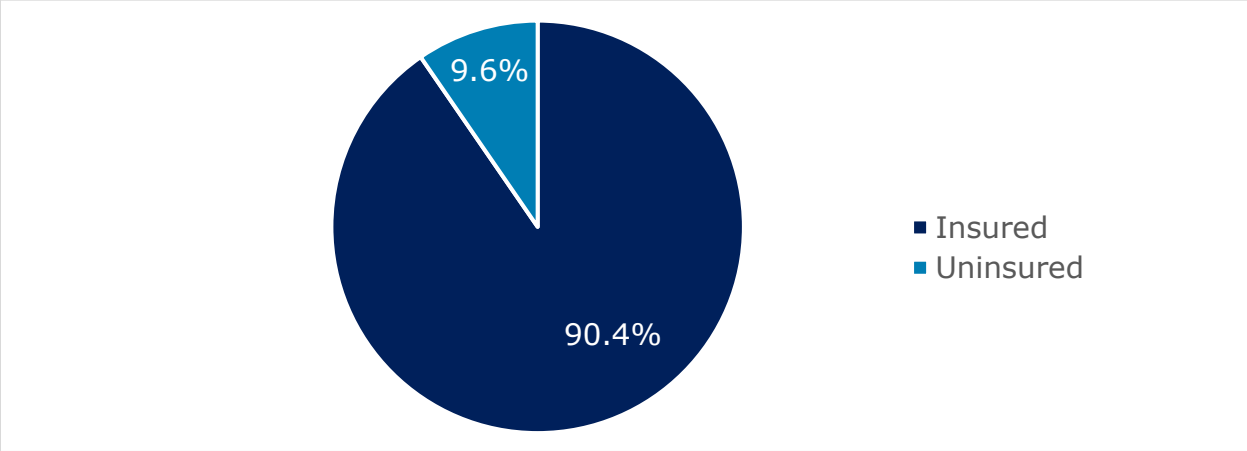
Source: Behavioral Risk Factor Surveillance System, 2022, Maricopa County

[9] AHRQ, 2013. 2012 National Healthcare Quality Report.
[10] CDC, 2022. Access to Health Services.

To better understand why some people may be going without a usual source of care, Exhibit 11 looks at what percentage of the PSA population is uninsured. These are individuals who may be falling through the cracks in the healthcare system.

In 2023, 9.6% of residents in the PSA were uninsured. While the majority had some form of health coverage, nearly one in ten people remained without insurance. This portion of the population may face more barriers when it comes to getting timely and affordable care.

Exhibit 11: Health Insurance Status, 2023 (PSA)

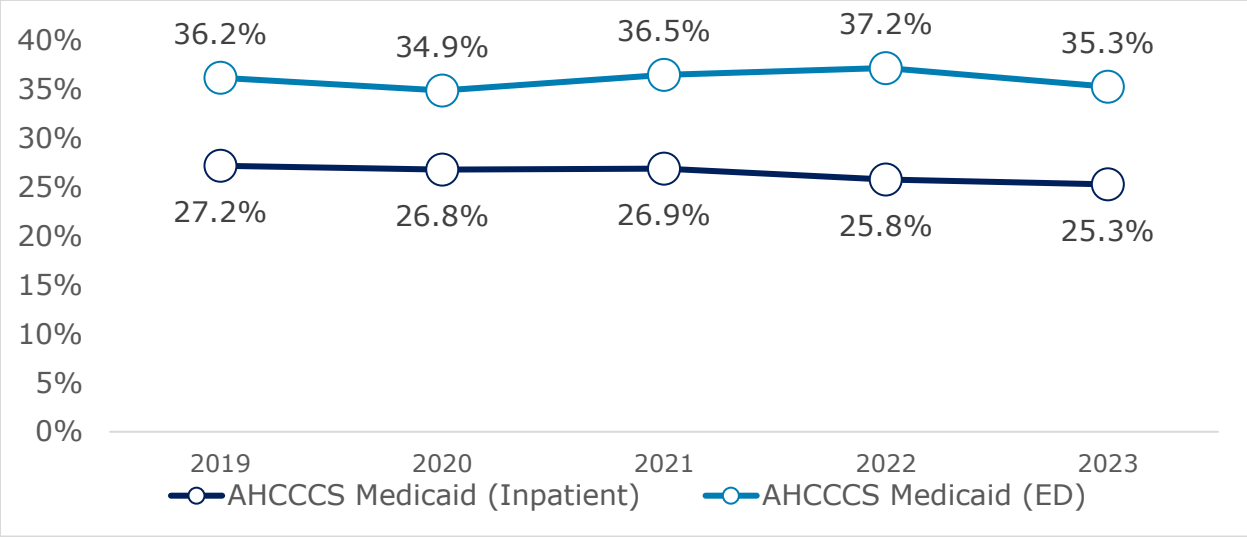


Source: U.S. Census Bureau American Community Survey 2019-2023 Five-year Estimates

Exhibit 12looks at trends in hospital visits covered by Medicaid, offering insight into how lower-income residents are accessing care, how demand on the system may be shifting, and where continued support may be needed.

Over the past five years, just over one in four inpatient stays in the PSA were covered by Medicaid, with rates gradually declining since 2021. ED visits were more likely to be billed to Medicaid, ranging from about 35 to 37%. These patterns highlight the steady role that public insurance plays in helping lower-income residents access both emergency and inpatient care.

Exhibit 12: Trends in AHCCCS Medicaid Coverage Among Hospital Visits, 2019–2023 (PSA)



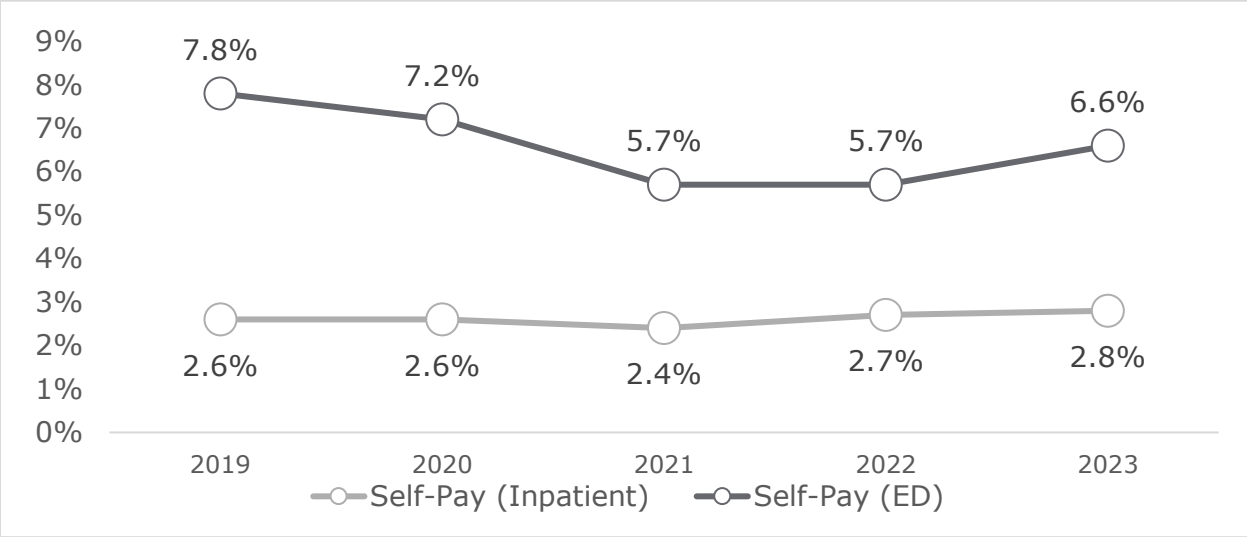
Source: Hospital Discharge Data, obtained from ADHS, cleaned and analyzed by MCDPH

While Medicaid trends help show how publicly insured residents are interacting with the healthcare system, it's also important to look at those who may be receiving care without any form of insurance.

Exhibit 13 shows trends in self-pay hospital visits, which can signal gaps in coverage, lead to financial hardship or delayed care that becomes more costly over time.[11]

Over the past five years, self-pay visits made up a small but consistent share of hospital use in the PSA, with ED visits notably higher than inpatient stays. ED rates declined from 2019 to 2021, held steady in 2022, then rose in 2023 to 6.6%. Inpatient self-pay visits stayed relatively low and stable, ranging from 2.4 to 2.8% over the five-year period. These patterns can offer insight into how many residents may be receiving care outside of the traditional insurance system.

Exhibit 13: Trends in Self-Pay Hospital Visits, 2019–2023 (PSA)



Source: Hospital Discharge Data, obtained from ADHS, cleaned and analyzed by MCDPH

[11] Scott et al., 2021. Catastrophic Health Expenditures Among the Uninsured.

Chronic Disease and Cancer

This section focuses on long-term conditions like heart disease, diabetes, and cancer. These indicators show how common these illnesses are in the community.

Chronic diseases like heart disease, diabetes, and cancer are common conditions in the United States that develop over time and are influenced by a mix of health behaviors, genetics, environment, and access to care.[12]

This section looks at how chronic disease and cancer show up in the healthcare system and in the community. It includes data on hospitalizations for chronic conditions and the most common types of cancer diagnosed in the county. Together, these indicators help show where long-term health needs are most visible and where prevention, early detection, and treatment efforts may have the greatest impact.

Exhibit 14 shows the percent change in hospitalization, emergency department visits, and deaths related to chronic diseases, comparing 2023 data to the four-year average from 2019–2022. This snapshot helps identify where rates are rising or falling, offering a clearer picture of emerging issues and areas where prevention or care management efforts may be making an impact.

Chronic disease patterns shifted in a few notable ways across the PSA. ED visits rose for several conditions, most notably for flu and pneumonia, COPD, stroke, and arthritis. These increases may reflect a growing reliance on emergency care for conditions that are often manageable in outpatient settings.

At the same time, deaths decreased for many chronic diseases, including Alzheimer's, asthma, and flu and pneumonia, suggesting some progress in treatment or prevention.

Inpatient hospitalizations remained mostly stable, with modest increases for a few conditions like asthma and hypertension. Hospitalizations for Alzheimer's and COPD declined.

Hypertension stood out as one of the only conditions with a rise in death rates, up about one-quarter compared to previous years. While it's difficult to draw conclusions from this death rate in a single year of data, the trend points to the continued importance of cardiovascular health management in the region.

[12] CDC, 2023. About Chronic Disease

Exhibit 14: Percent Change Chronic Disease Related Hospitalizations and Deaths Between 2023 and 4-Year Averages (2019-2022)[13] (PSA)

	Inpatient	ED	Death
Alzheimer's	-14.1	-35.8	-27.7
Arthritis	-58.1[14]	13.8	
Asthma	11.6	-5.8	-17.5
Cardiovascular Disease	2.9	10.1	0.2
Chronic Obstructive Pulmonary Disease	-16.4	20.6	-14.4
Diabetes	0.7	-0.5	-4.6
Flu & Pneumonia	1.6	20.9	-27.6
Hypertension	10.3	7.1	24.2
Kidney Disease	4.1	13.3	0.0
Long COVID[15]	23.8	22.6	
Overweight & Obesity	-1.6	-21.6	
Stroke	0.2	15.7	-0.2

Source: Hospital Discharge Data, obtained from ADHS, cleaned and analyzed by MCDPH

[13] Color gradient indicates the direction and magnitude of change. Green cells reflect a decrease in rates (improvement), while red cells indicate an increase in rates (worsening outcomes). Darker shades represent larger changes. For Arthritis, Long COVID, and Overweight/Obesity, death rates are not reported.
[14] The decline in arthritis IP rates may stem from reduced osteoarthritis cases from 2019-2023, due to coding changes or a true population decline.
[15] The rise in Long COVID-related hospital visits likely reflects a combination of increased diagnostic coding and greater awareness rather than a direct comparison to pre-pandemic years.

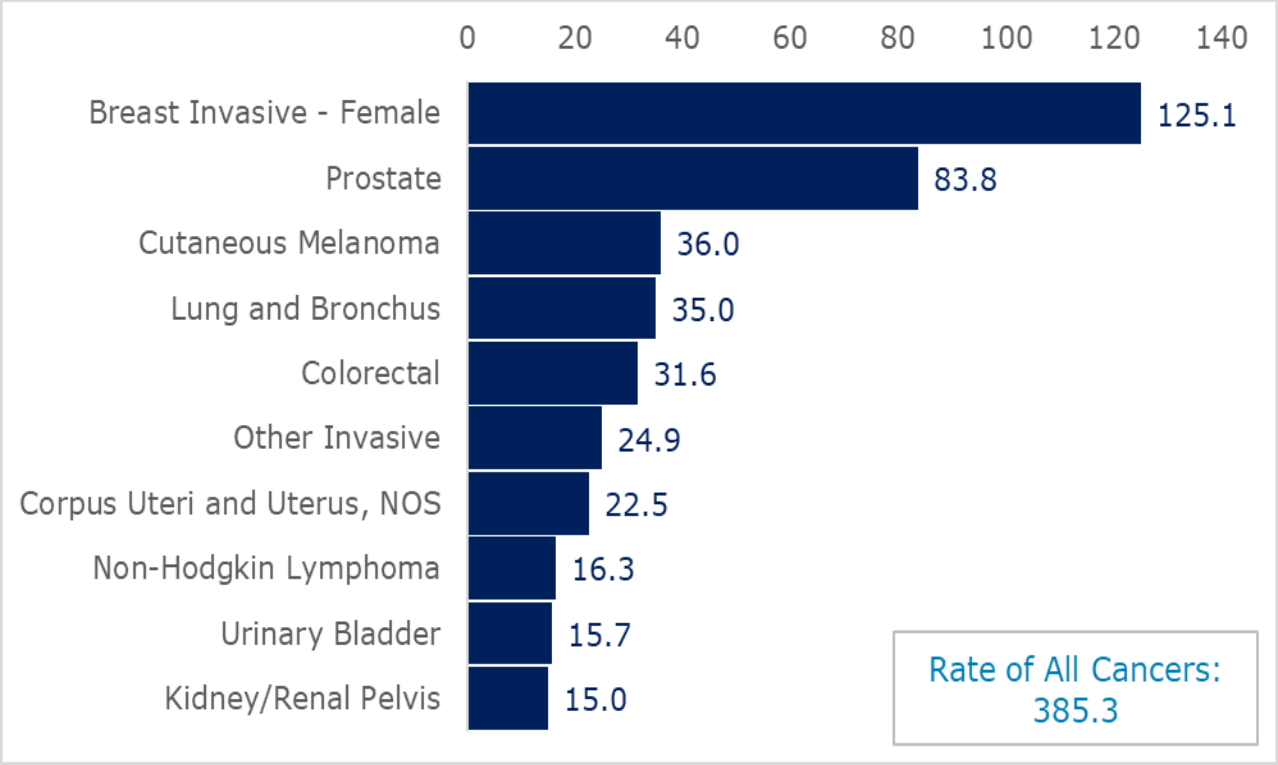
Cancer is another significant part of the chronic disease landscape in the community. Many of the same factors that influence conditions like diabetes or heart disease, including access to screening, early detection, and consistent care, can also affect cancer. Exhibit 15 highlights cancer incidence patterns across Maricopa County.

In 2022, the overall cancer incidence rate in the county was 385.3 cases per 100,000 people. The most commonly diagnosed cancers included:

- Breast and prostate cancer, had notably higher incidence rates compared to other types of cancer.
- Melanoma, lung, and colorectal cancers occurred as the next most frequent.

Understanding which cancers are most commonly diagnosed helps inform prevention and screening strategies across the region.

Exhibit 15: Cancer Incidence by Type, 2022 Age-Adjusted Rates per 100,000 (Maricopa County)[16]



Source: ADHS Cancer Registry

[16] Only Arizona residents are included. County at diagnosis is collected for every cancer case.

Mental Health and Substance Use

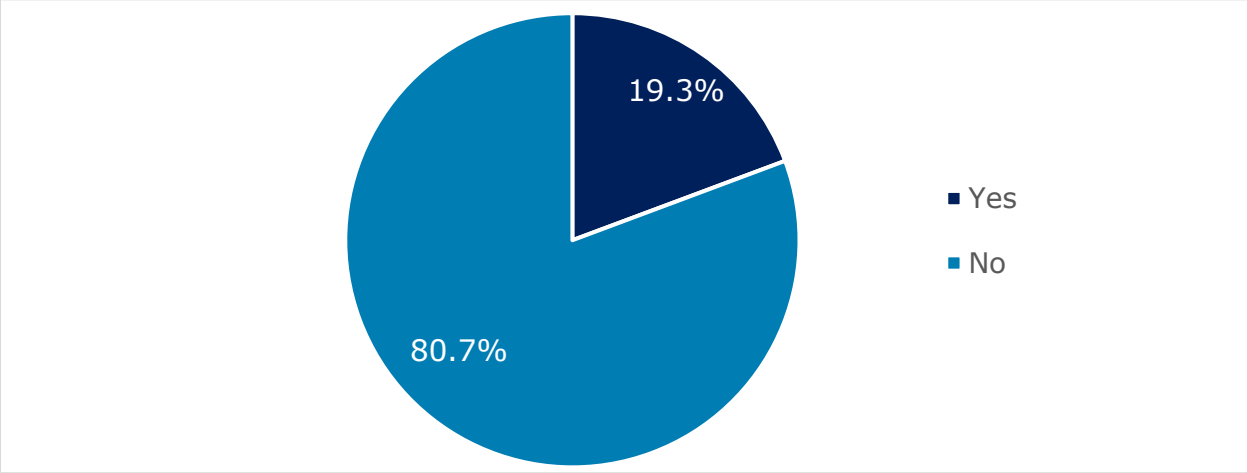
This section includes data on mental health diagnoses, hospital visits for mental health or substance use, and deaths related to suicide, alcohol, or drug use.

Mental health is an important part of overall well-being, affecting how people manage stress, maintain relationships, and engage with their communities.[17] Understanding the scope of mental health needs in the region begins with looking at how many people report living with a diagnosed condition.

Exhibit 16 shows that in 2022, 19.3% of adults in Maricopa County said a medical provider had told them they have or had a depressive disorder, according to BRFSS data. This reflects nearly one in five adults, highlighting how common depression is across the county's population.

While this indicator doesn't capture undiagnosed conditions or the severity of symptoms, it does show how many residents have had at least one interaction with the healthcare system where a mental health concern was identified. This makes it a useful starting point for understanding diagnosed mental health conditions in the community and sets the stage for the next set of data, which focuses on more acute issues like hospitalizations, suicide, and substance-related crises.

Exhibit 16: Has a Medical Provider Ever Told You That You Have/Had a Depressive Disorder?, 2022 (Maricopa County)



Source: Behavioral Risk Factor Surveillance System, 2022, Maricopa County

[17] CDC, 2024. Mental Health: About Behavioral Health.

To better understand how mental health challenges show up in more acute settings, Exhibit 17 explores inpatient hospitalizations related to mental health disorders.

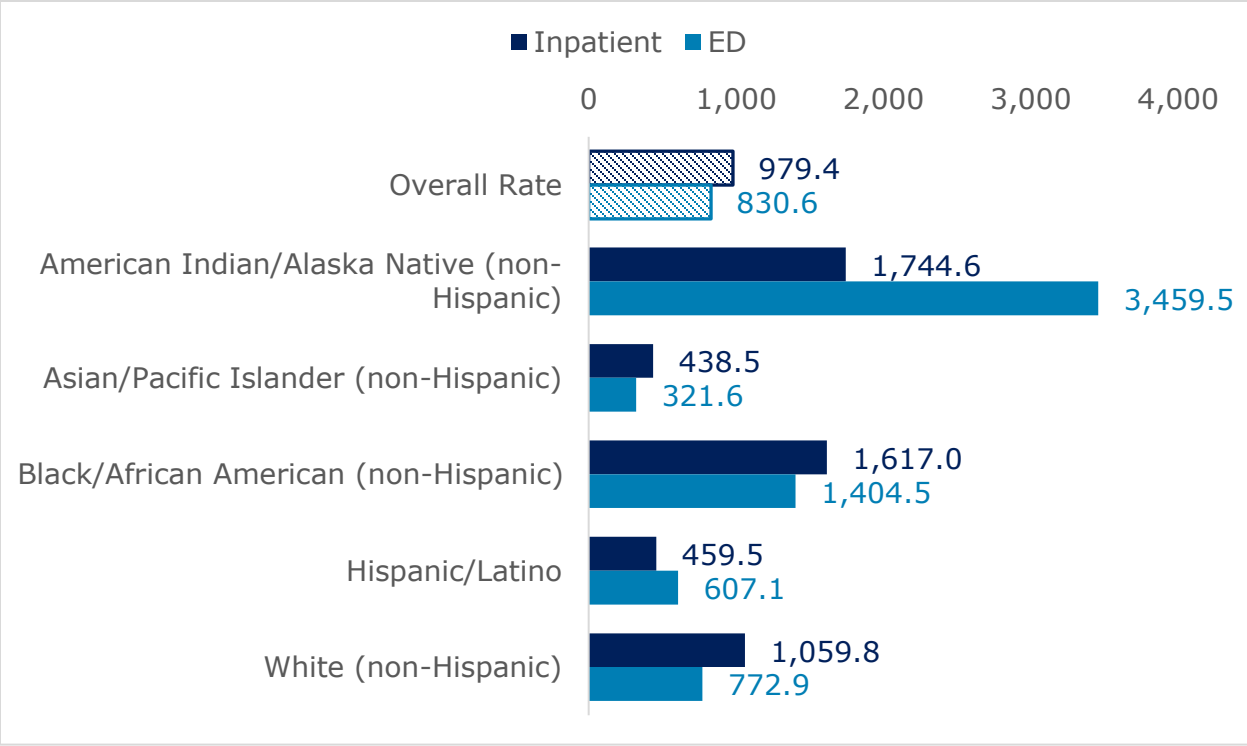
This data is broken out by race and ethnicity to help highlight differences in how various groups are accessing or experiencing hospital-based mental health care. This can offer insight into potential disparities in severity, access to outpatient treatment, or the availability of early intervention.

In 2023, American Indian and Alaska Native residents had the highest rates of mental health disorder diagnoses, with ED visits more than four times the overall rate and elevated inpatient use as well. Black/African American residents also had high rates in both settings.

On the lower end, Asian/Pacific Islander and Hispanic/Latino residents had the lowest rates of inpatient and ED visits. White residents were close to the overall rate, with slightly higher inpatient use.

These patterns may reflect differences in access, need, or when and how people seek care. Because some groups make up a smaller share of the population, small changes in visit numbers can lead to large shifts in rates.

Exhibit 17: Hospital Discharge Diagnosis: All Mental Health Disorders, 2023 Age-Adjusted Rates per 100,000, by Race/Ethnicity[18] (PSA)



Source: Hospital discharge data and death records, obtained from ADHS, cleaned and analyzed by MCDPH

[18] Primary diagnosis of a mental, behavioral, or neurodevelopmental disorder using ICD-10-CM codes.

While hospitalizations reflect serious mental health needs that result in clinical care, they don't tell the whole story. Mental health, substance use, and self-harm are often closely linked, and the lines between them can be hard to separate in real-world experiences.

Exhibit 18 looks at percent changes in hospitalization and death rates tied to alcohol use, drug-related conditions, opioid overdose, and self-harm from 2023 compared to the previous four-year period. These shifts offer a snapshot of how behavioral health issues are showing up across the healthcare system.

In the PSA, alcohol-related hospital visits increased in 2023, with emergency department visits up by nearly 10% and inpatient stays up by 6%. In contrast, most other indicators declined. Hospitalizations and deaths tied to self-harm dropped by more than 10%, and drug-related visits and deaths also decreased. Opioid overdose deaths, however, rose by about 5%, even as related hospital visits stayed relatively stable.

Exhibit 18: Percent Change in Substance/Behavioral Health Risk Factor Related Hospitalizations and Deaths Between 2023 and 4-Year Averages (2019-2022)[19] (PSA)

	Inpatient	ED	Death
Alcohol Related	6.0	9.7	-12.5
All Drug Related	-15.5	-6.9	-4.7
Opioid Overdose	-10.3	-0.7	5.0
Self-Harm/Suicide	-10.1	-13.5	-16.8

Source: Hospital discharge data and death records, obtained from ADHS, cleaned and analyzed by MCDPH

[19] Color gradient indicates the direction and magnitude of change. Green cells reflect a decrease in rates (improvement), while red cells indicate an increase in rates (worsening outcomes). Darker shades represent larger changes.

Injury and Safety

These indicators reflect how often people go to the hospital or die because of injuries, such as falls or accidents. The data helps identify where prevention efforts might be needed.

Injuries are a major public health concern in the U.S., accounting for more than 222,000 deaths in 2023 and over 40 million emergency department visits in 2022.[20,21] They often happen without warning and can cause lasting harm to individuals, families, and communities.

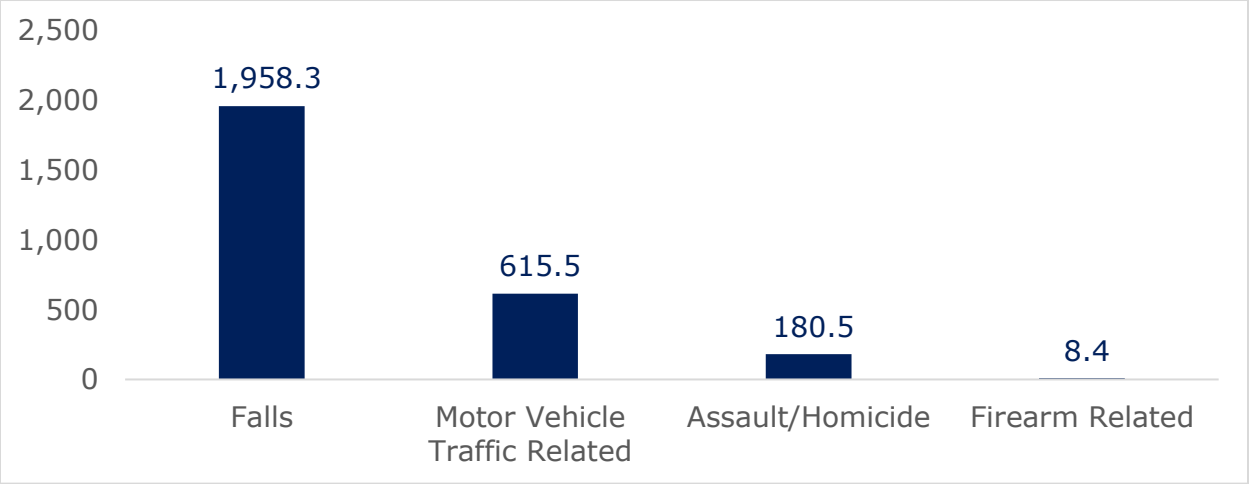
Injury-related emergency department visits offer a snapshot of how often people are seeking urgent care for accidents, falls, and other unintentional harm.

Exhibit 19 shows how these visits vary by injury type. This data can help guide community efforts to reduce injury risks and improve safety for all residents.

In the PSA in 2023, falls were by far the most common reason for injury-related ED visits. The rate was more than three times higher than for motor vehicle injuries and over ten times higher than for assaults or homicides. Firearm-related injuries made up only a small fraction of visits.

These patterns suggest that falls account for much of the local injury burden. At the same time, motor vehicle crashes and violence-related injuries still represent important areas for community prevention and safety efforts.

Exhibit 19: Injury-Related Emergency Department Visits, 2023 Age-Adjusted Rates per 100,000 (PSA)



Source: Hospital discharge data and death records, obtained from ADHS, cleaned and analyzed by MCDPH

[20] CDC, 2025. Leading Causes of Death.
[21] CDC, 2025. Injuries.

Exhibit 20 compares 2023 rates of injury-related hospital visits and deaths to four-year averages from 2019 to 2022.

In the PSA, injury-related trends show mixed patterns. Hospitalizations and deaths from firearms and assault dropped between 2023 and the four-year average, while emergency visits for falls and all injuries climbed. Motor vehicle-related deaths rose by nearly 11%, even though related hospital and ED visits were up by smaller amounts.

Exhibit 20: Percent Change in Injury Related Hospitalizations and Deaths Between 2023 and 4-Year Averages (2019-2022)[22] (PSA)

	Inpatient	ED	Death
All Injuries	-1.3	7.1	-3.0
Assault/Homicide	-16.5	-0.2	-4.0
Fall Related Injuries	0.9	9.1	-2.3
Firearm Related	-14.6	-27.9	-3.5
Motor Vehicle Traffic Related	5.2	3.1	10.9

Source: Hospital discharge data and death records, obtained from ADHS, cleaned and analyzed by MCDPH

[22] Color gradient indicates the direction and magnitude of change. Green cells reflect a decrease in rates (improvement), while red cells indicate an increase in rates (worsening outcomes). Darker shades represent larger changes.

Maternal and Child Health

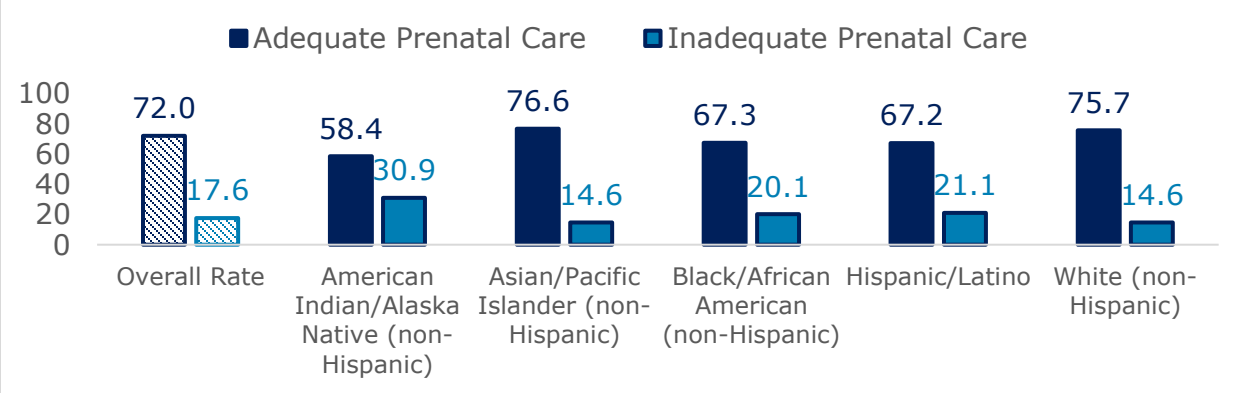
This section highlights key indicators related to the health of mothers and infants. It includes data on prenatal care, birth outcomes like low birthweight and preterm births, and teen birth rates.

Maternal and child health is a cornerstone of community well-being. When mothers receive the care they need before, during, and after pregnancy, it can lead to healthier outcomes for both parent and child. These outcomes shape not only the earliest stages of life but also long-term health and development. Looking at trends in maternal and child health helps identify where families may be facing barriers to care and highlights differences in birth outcomes that can guide efforts to support health equity.

Exhibit 21 shows rates of adequate and inadequate prenatal care by race and ethnicity. Prenatal care is a critical part of a healthy pregnancy. It helps detect and manage potential risks, ensures timely screenings, and connects families with important support and education.[23] Disparities in prenatal care access may point to broader gaps in healthcare coverage, availability of services, or cultural and language barriers within the healthcare system.

In the PSA in 2023, nearly one in five birthing parents received inadequate prenatal care. Rates were highest among American Indian/Alaska Native residents, with nearly one in three receiving inadequate care. Black/African American and Hispanic/Latino residents had rates just over one in five. White and Asian/Pacific Islander residents had the lowest rates, both around 15%. Because population sizes vary, some differences may appear larger or smaller depending on the size of the group.

Exhibit 21: Prenatal Care, 2023 Crude Rates per 100 Live Births (PSA)



Source: Birth and death records, obtained from ADHS, cleaned and analyzed by MCDP

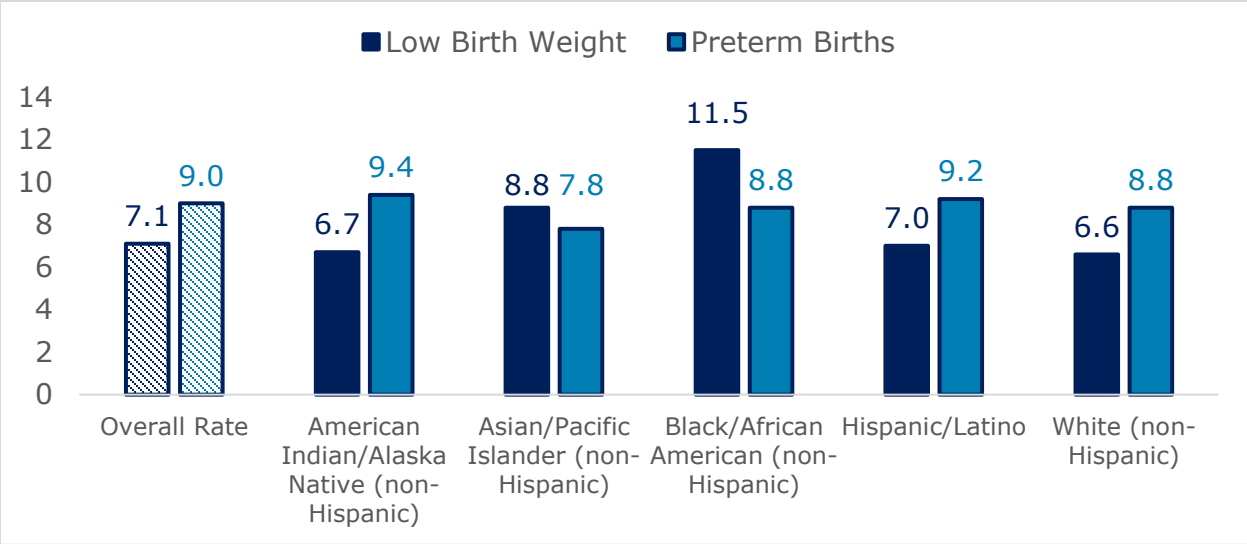
[23] Albarqi, 2025.

Access to early and consistent prenatal care can influence how pregnancies progress and how babies are born.

Exhibit 22 looks at rates of low birth weight and preterm birth, which are key indicators of newborn health.

In the PSA in 2023, Black/African American newborns had the highest rates of both low birth weight and preterm birth, well above the overall rate. Most other groups were close to the overall rate, with small differences between the two indicators. Because population sizes vary, some of these differences may appear larger or smaller depending on the size of the group.

Exhibit 22: Low Birth Weight and Preterm Births, 2023 Crude Rates per 100 Live Births (PSA)



Source: Birth and death records, obtained from ADHS, cleaned and analyzed by MCDP

In addition to birth weight and prematurity, other maternal and infant health indicators can help show how conditions are changing over time. For example, teen birth rates reflect how often young people are becoming parents, which can carry added health, financial, and social risks. [24] Infant mortality, which is closely tied to maternal health, prenatal care, and broader social conditions, reflects the most serious outcomes for newborns. [25]

Exhibit 23 shows shifts in several maternal and infant health indicators compared to the previous four-year averages across the PSA. Inadequate prenatal care and teen births both declined, and there was a slight drop in preterm births. Meanwhile, the share of low birth weight babies rose by 6%, and infant mortality increased by more than 18%, the largest change among these measures. This mirrors a national trend: according to the CDC, the U.S. infant mortality rate rose by 3% between 2021 and 2022, the first statistically significant increase in two decades.[26]

Exhibit 23: Percent Change in Maternal and Infant Health Indicators Between 2022 and 4-Year Averages (2018-2021)[27] (PSA)

	Percent Change
Inadequate Prenatal Care	-5.6
Low Birth Weight	6.0
Preterm Births	-0.8
Teen Births	-7.7
Infant Mortality Rate	18.1

Source: Birth and death records, obtained from ADHS, cleaned and analyzed by MCDP

[24] CDC, 2015. Teen Childbearing Consequences.
[25] CDC, 2024. Infant Mortality.
[26] Arias et al., 2023. Infant Mortality in the U.S.
[27] Color gradient indicates the direction and magnitude of change. Green cells reflect a decrease in rates (improvement), while red cells indicate an increase in rates (worsening outcomes). Darker shades represent larger changes. Birth rates are Crude Rates per 100 Live Births for Adequate/Inadequate Prenatal Care, Low Birthweight, and Preterm Birth. For Teenage Birth, rates are Crude Rates of Live Births Among Females Aged 15-19 Years per 1,000 Females Aged 15-19 Years. For Infant Mortality rates are Crude Rates per 1,000 Live Births.

Social and Environmental Drivers of Health

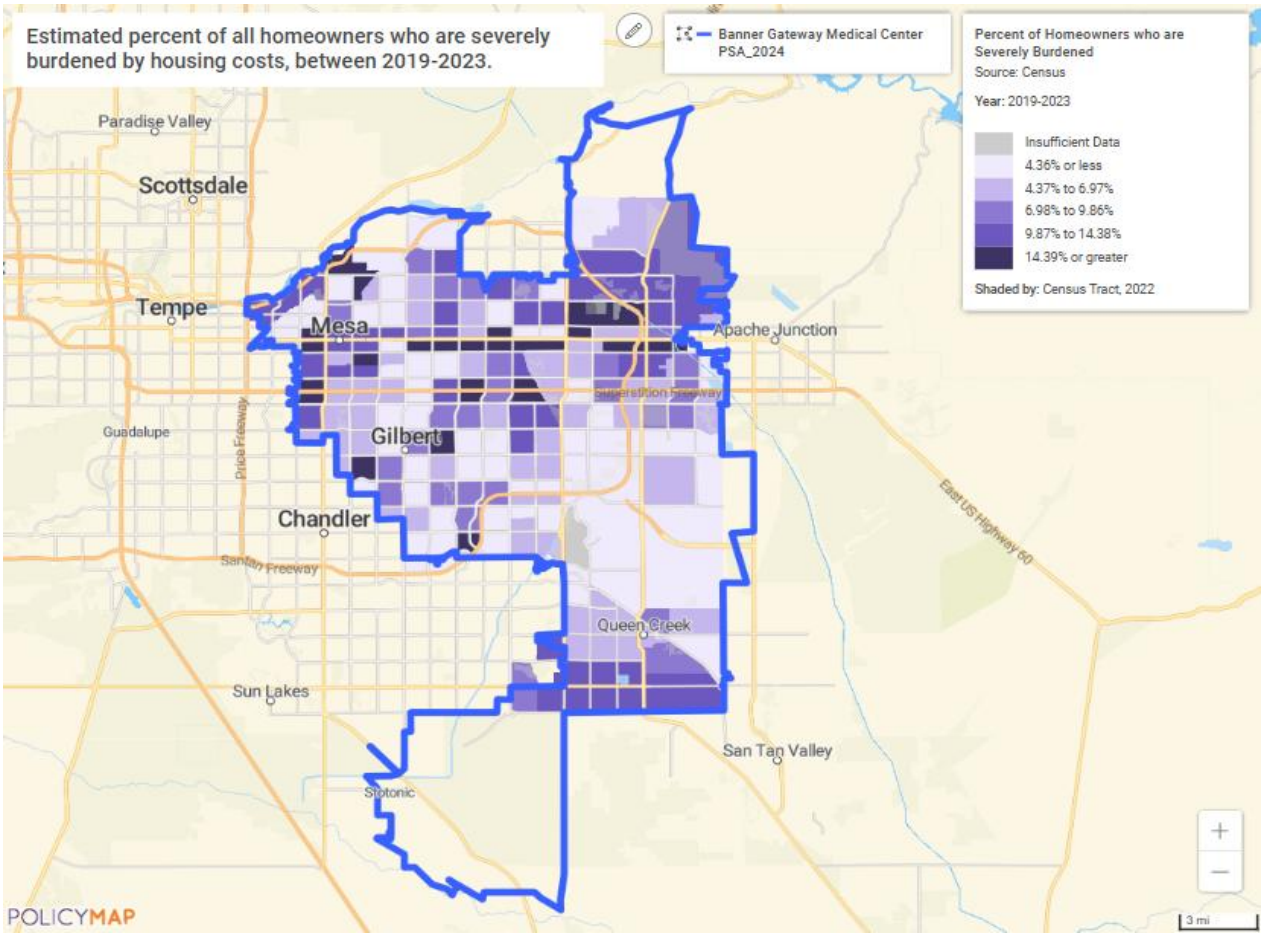
This section highlights community conditions that affect health over time, such as access to transportation, housing costs, and exposure to extreme heat. These factors influence people's ability to stay healthy and safe where they live.

Health is deeply connected to where and how people live. When housing costs take up a large portion of a household's income, it can make it harder to afford other essentials like food, transportation, and healthcare.[28]

Exhibit 24 on the next page shows the estimated percentage of homeowners who are severely burdened by housing costs across the PSA. A household is considered severely cost burdened if it spends more than 50% of income on housing. The map reveals geographic differences in housing affordability, with higher rates of cost burden concentrated in the central part of the PSA. These areas are shaded in the darkest purple, indicating that more than 14.4% of homeowners spend a substantial portion of their income on housing.

[28] Healthy People 2030. Social Determinants of Health.

Exhibit 24: Estimated Percent of All Homeowners Who Are Severely Burdened by Housing Costs; 2019-2023[29] (PSA)



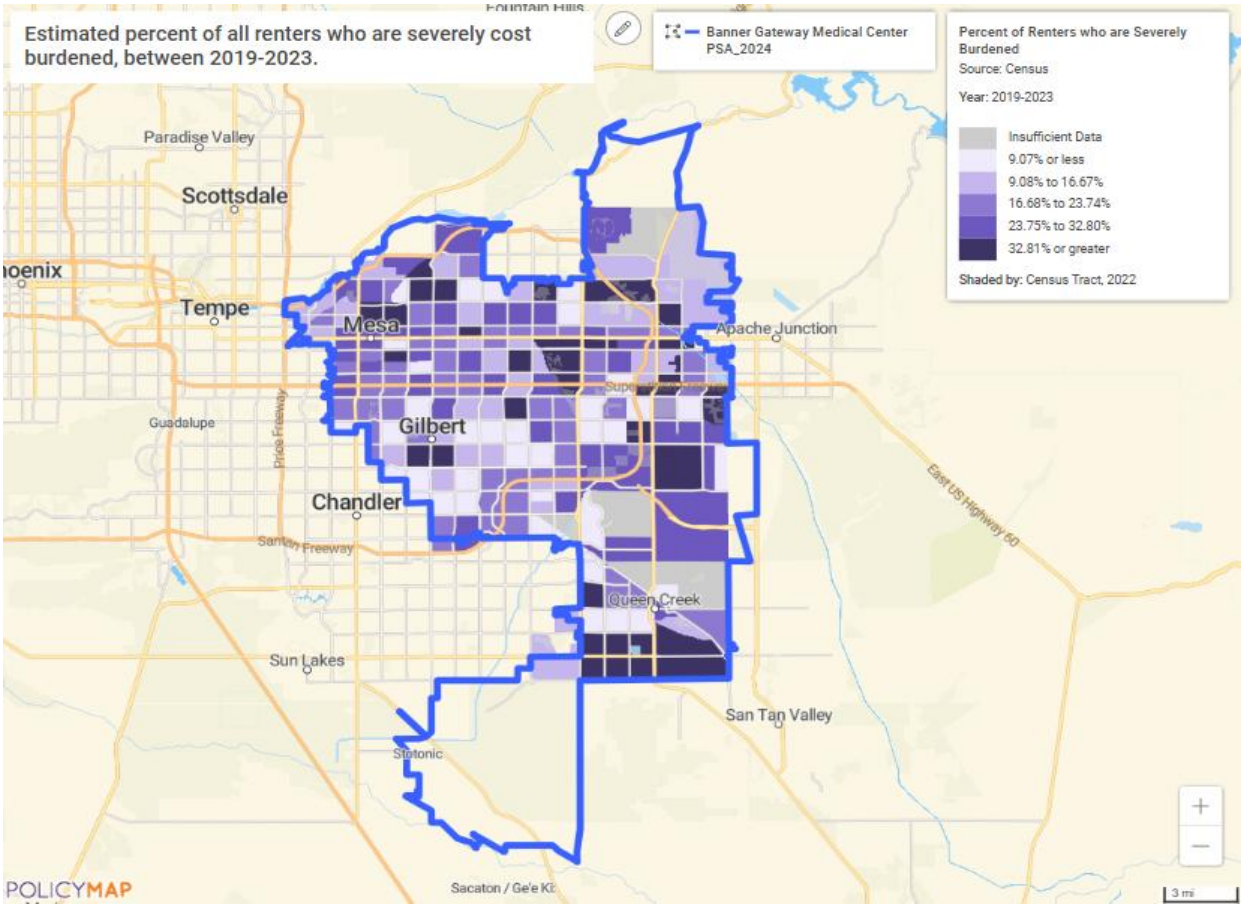
Source: PolicyMap; US Census

[29] Estimated percent of owner households for whom selected monthly owner costs are 50% or more of household income, between 2019-2023. Owner housing costs include all mortgage principal payments, interest payments, real estate taxes, property insurance, homeowner fees, condo or coop fees and utilities (not including telephone or cable television).

While many homeowners experience financial strain, renters often face even greater housing cost challenges. Exhibit 25 shows the estimated percentage of renters across the PSA who are severely burdened by housing costs, spending more than half of their income on rent.

The map highlights especially high rates in pockets throughout the PSA. These areas are shaded in the darkest purple, indicating that more than 32.8% of renters spend a substantial portion of their income on housing. These areas may face increased risk of housing instability, displacement, and related health impacts, particularly for lower-income residents who have fewer financial safety nets.

Exhibit 25: Estimated Percent of All Renters Who Are Severely Cost Burdened 2019-2023[30] (PSA)



Source: PolicyMap; US Census

[30] Percent of renter households for whom gross rent is 50% or more of household income, between 2019-2023. Gross rent is the contract rent plus the estimated average monthly cost of utilities (electricity, gas, water and sewer) and fuels (oil, coal, kerosene, wood, etc.) if these are paid by the renter (or paid for the renter by someone else). Gross rent is intended to eliminate differentials that result from varying practices with respect to the inclusion of utilities and fuels as part of the rental payment.

High housing costs can force difficult tradeoffs: when a large share of income goes to rent, there may be less left for essentials like food, medicine, or cooling. One way this strain shows up is through food insecurity.

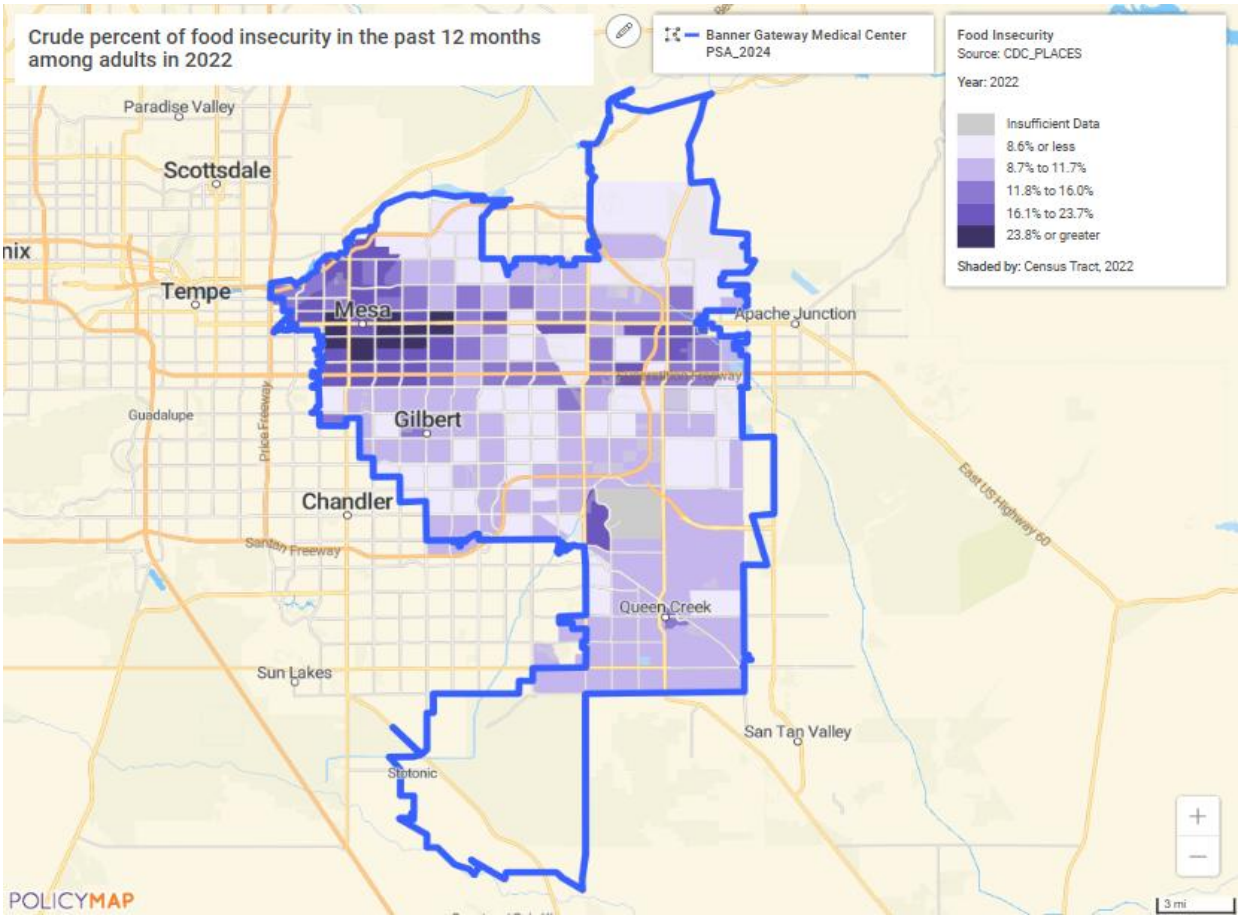
Food insecurity is closely linked to both short-term and long-term health problems, including stress, chronic disease, and poor nutrition outcomes.[31]

[31] HHS, n.d. Food Insecurity.

Exhibit 26 on the next page shows the estimated percent of adults in the PSA who experienced food insecurity in the past year. These estimates come from a national survey question asking whether people ran out of food and didn't have money to buy more. It reflects how many adults said this happened to them sometimes, usually, or always.

The western region of the PSA surrounding Mesa has a particularly high prevalence of food insecurity. These areas are shaded in the darkest purple, indicating that more than 23.8% of adults experienced food insecurity in the past year.

Exhibit 26: Access to Food: Crude Percent of Food Insecurity in the Past 12 Months Among Adults in 2022[32] (PSA)



Source: PolicyMap; CDC PLACES

The health risks tied to food insecurity often overlap with other challenges, especially during periods of extreme weather. In Maricopa County, rising temperatures have increased the risk of serious illness or death, particularly for older adults, people with chronic conditions, and those without stable housing or air conditioning.[33]

[32] A multi-level regression and post-stratification approach was applied to BRFSS and ACS data to compute a detailed probability among adults who reported that the food that they bought always/usually/sometimes did not last, and they didn't have money to get more. The probability was then applied to the detailed population estimates at the appropriate geographic level to generate the prevalence.
[33] CDC, 2023. Temperature Extremes.

Exhibit 27 on the next page shows the number of heat-related deaths in Maricopa County over the past decade. This is an increasing concern in Maricopa County, where rising summer temperatures have had a growing impact on health and safety.[34]

The data shows a sharp rise in heat-related deaths over time:

- In 2023, 645 deaths were attributed to heat - the highest on record and a 52% increase from the year before.
- More than half (59%) of these deaths were classified as heat caused, meaning heat was the direct cause of death, not just a contributing factor.
- Since 2016, the number of deaths has risen almost every year, highlighting a sustained public health trend.

This upward trend underscores the importance of heat response strategies, including access to cooling, safe housing, and outreach to at-risk populations.

[34] MacDonald Evoy, 2025.

Exhibit 27: Heat Related Deaths Over Time (Maricopa County)

Qualitative Data Findings

Methodology

The qualitative findings presented in this report were derived from a previously conducted and published qualitative analysis found in the Community Health Needs Assessment 2024 Focus Group Findings and Appendix[35] and the Community Health Needs Assessment 2024 Key Informant Interviews.[36] The former is a result of a collaborative effort between MCDPH and SIRC; together, they conducted 46 focus groups with 366 focus group participants from 15 priority populations. The latter is a result of a collaborative effort between the MCDPH and the Omni Institute, in which 24 key informants were interviewed. To ensure the integrity of the data and the analysis, all participant quotes, themes, subthemes, and narrative insights were used as they appeared in the original report, with minimal edits made for readability. This approach was used to respectfully represent the voices of the community and accurately portray the analysis conducted by MCDPH and its partners. A reinterpretation or reanalysis of the raw qualitative data was not conducted as part of this effort.

For the purposes of this report, the existing themes found in the CHNA 2024 Focus Group Findings and Appendix were organized into Strengths, Themes, and Needs.

Relevant insights from key informants were included in each section as appropriate. Visualizations were developed to concisely represent the original qualitative findings within these categories. The qualitative findings were consolidated to present a concise summary of the full analysis. Please refer to the original documents for a comprehensive qualitative analysis of the data.

> **Strengths** can serve as resources to address the needs identified.
>
> **Themes** are conceptual considerations that provide context so that needs are addressed in a way that is responsive to the culture and identity of the community.
>
> **Needs** are actionable areas that participants highlighted as the most pressing challenges, barriers, and concerns they face in their community.

These three concepts are intertwined and must be considered holistically to better understand and better utilize the data collected to make positive changes.

[35]Maricopa County CHNA 2023 Focus Group Findings: https://www.maricopa.gov/DocumentCenter/View/92376/2023-Focus-Group-Report-Findings ; Maricopa County CHNA 2023 Focus Group Findings Appendix: https://www.maricopa.gov/DocumentCenter/View/96246/2023-Focus-Group-Report-Appendices

[36] Maricopa County CHNA 2024 Key Informant Interviews: https://www.maricopa.gov/DocumentCenter/View/94150/2024-CHNA-Key-Informant-Interviews-Report_FINAL_52224

Strengths

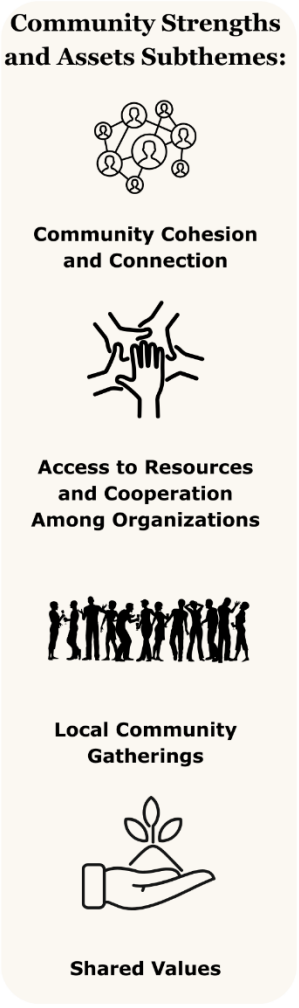
Strengths are characteristics, resources, or other factors in a community that promote members' quality of life and community sustainability.

Community Members and Organizations

Across the focus groups and key informant interviews, many strengths were discussed relating to the participants' communities. Focus group participants discussed how they related to their neighbors and how community members affected them and their families. Answers from several groups described positive attributes such as a supportive environment, helpful neighbors, and a welcoming atmosphere.

> "You know your neighbors. You're able to share their life as well as theirs with you, a nice store, a nice church. You look out for each other. You feel safe. If you're not there, you know you still have a block watch around you in your neighborhood to where you all look out for each other."
>
> - *Low-Income Seniors Focus Group*

Key informants in the community shared similar views regarding the strengths of the community. Community members themselves were seen as a key strength, including their resiliency, resourcefulness, and commitment to protecting one another. According to participants, communities' knowledge, connections, pride, and cultural cohesion contribute to community well-being. Participants also highlighted various agencies, organizations, and programs within Maricopa County as a key strength.



> "We come out and help and support in any way that we can because of some of the work that they're doing with justice-involved folks, giving them employment, teaching them life skills and the life, could really mean their life [was] impacted for the better and [they do not have] to resort to old mindsets and behavior mistakes."
>
> - *Key Informant*

Themes

Themes are systemic factors that impact how a community functions and should be considered when leveraging strengths to meet the needs.

Systems of Power, Privilege, and Oppression

The theme systems of power, privilege, and oppression represent the root causes or structural drivers of inequity. Structural inequity is when one social group has a systematic disadvantage compared to other groups.[37] Focus group participants' perception of health, community representation, and racism was expressed during the focus group interviews. Racism, oppression, discrimination, and lack of community safety were uniquely experienced by minority ethnic groups and special populations. These experiences were categorized into eight subthemes:

- discrimination, racism, or oppression
- provider competency
- community safety
- neighborhood characteristics
- social connectedness
- community representation
- community care or mutual aid
- structural racism

> "When I finally saw the spinal surgeon, he said that if I had been diagnosed within the first three to four months of my symptoms, then I'd have an 80% chance of recovering full capabilities. Because it took so long to see the neurologist, and then the neurologist, even though I gave her my symptoms right away—and as a Black woman, they don't listen."
>
> - *Rural Focus Group*

Power, Privilege, and Oppression Subthemes:

Discrimination, Racism, Oppression, or Structural Racism

Provider Competency and Community Representation

Community Safety and Neighborhood Characteristics

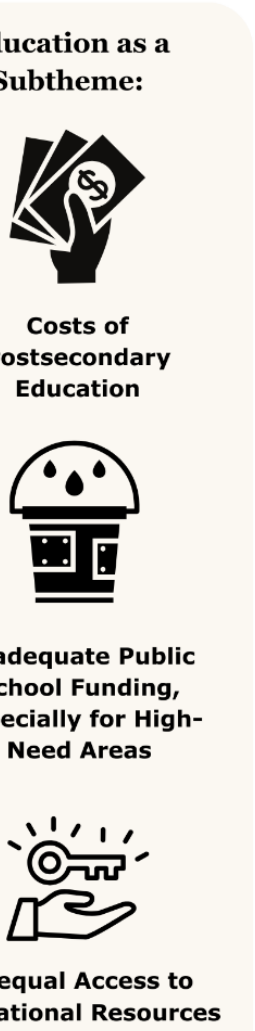
Community Care, Social Connectedness, and Education

[37] Baciu et al., 2017

Key informants also identified several disparities across community members as well as challenges and barriers to developing services and programming. These disparities were seen to impact historically marginalized communities, including communities of color, undocumented populations, and unhoused populations.

Education

Focus group discussions regarding education focused on the negative aspects of the state of education. The financial aspects of education were prevalent throughout. A participant from the low-income Hispanic focus group mentioned she was torn between wanting her daughter to attend college and the affordability of that education. In a similar vein, one of the participants from a general population focus group expressed the opinion that schools are unequally funded; with many lower-income schools struggling. Cost was also mentioned by a participant in a youth focus group who said that college classes were available to students in her high school, but the price of books alone was prohibitive. In keeping with this financial theme, a lower income Hispanic participant expressed a wish for an English language school for adults, and a fellow participant explains how that would help their community get better jobs.

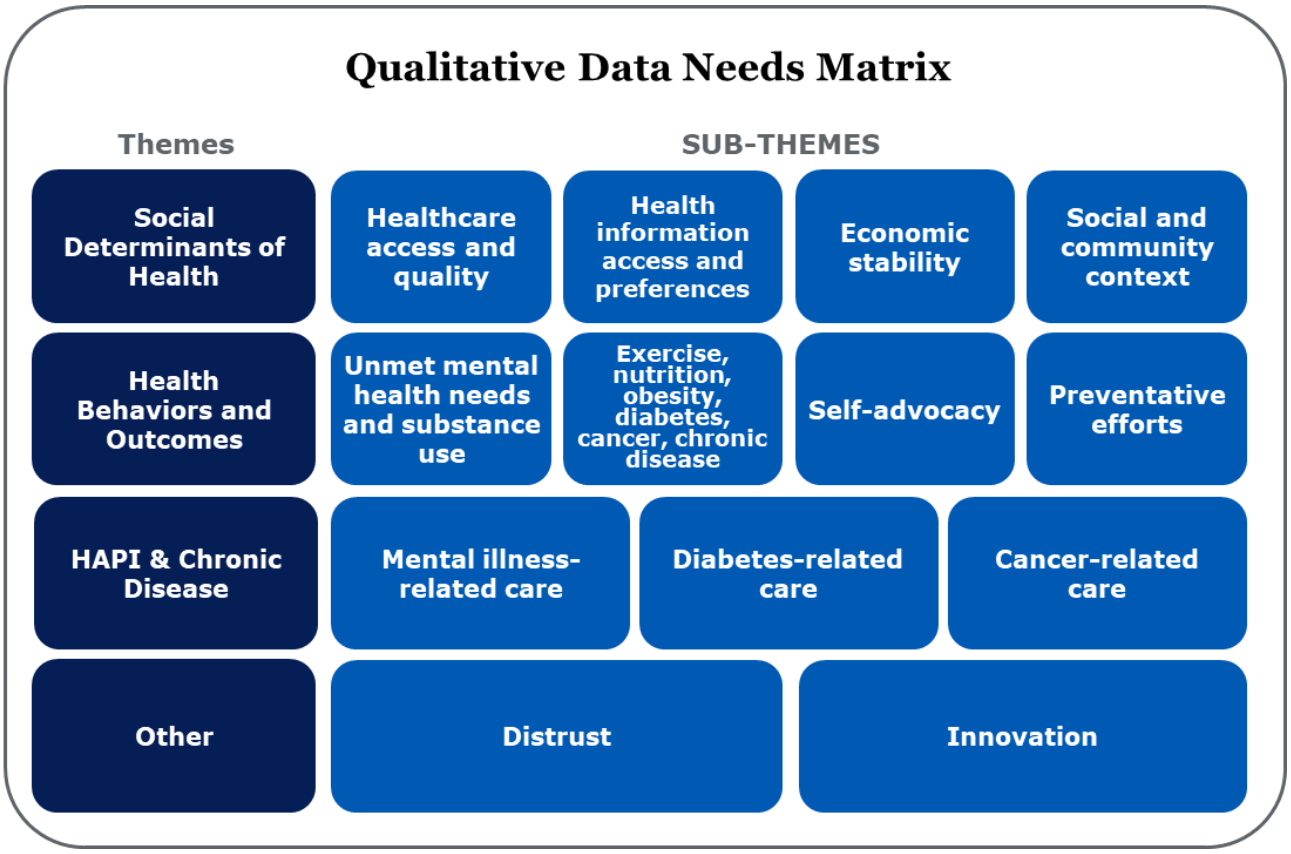


> "Education in Arizona is one of the worst. I can statistically say, I got the bottom of the barrel. Having more funds for education, that could help us learn, cause I went to high school in Minnesota. I went to high school there, and it was a way different experience."
>
> - *Refugee/Immigrant/Migrant Focus Group*

In contrast to the focus group discussions, key informants detailed the strengths of the education system in Maricopa County, specifically the strengths related to local universities and some of the public school districts, which participants noted are leading to positive change and growth. The options of public charter schools were also discussed and seen as an asset. A participant with two children, one in high school and one in elementary school, noted the educational opportunities afforded to youth in the community. Examples of such programs included an aeronautics/aerospace summer camp and additional language courses.

Needs

Needs are actionable areas that participants highlighted as the most pressing challenges, barriers, and concerns they face in their community.



Social Drivers of Health

The social drivers of health theme served to identify outside factors and occurrences that impact different aspects of a community's health and public health system. These factors, also known as social determinants of health, are a result of interrelated and often complex social and economic systems, and include characteristics such as socioeconomic status, access to health care, and the physical environment.[38] Four subthemes were identified under forces of change and are presented in order from most to least discussed:

- health care access and quality
- health information access and preferences
- economic stability
- social and community context

> "Sometimes places are too far away and you don't have the means to get there, so it's a problem."
>
> - *Low-Income Hispanic Focus Group*

Several key informants discussed that access to healthcare services can also vary across neighborhoods according to participants, with a scarcity of hospitals, clinics, and pharmacies in certain areas. In more outlying cities, healthcare access can be spread out, one participant noted for their community. The participant described one large hospital and a smaller hospital in their northwest city and mentioned that community members needed to travel to neighboring cities for more options. Another participant whose facility is in Phoenix described lack of healthcare options, coupled with lack of police presence, which leads to issues of public safety. Some informants noted that individuals who rely on

[38] CDC, 2024. SDOH.

public transportation or who have mobility issues experience increased difficulties in accessing medical appointments.

> "It is a wildly inequitable environment for those who are living with blindness and visual impairment because society isn't tilted towards them…I think that there needs to be healthcare that's really sensitive. And I think that the county is really well positioned to be able to work with … hospitals in the area, as to how to provide that responsive healthcare."
>
> - *Key Informant*

Health Behaviors and Outcomes

The theme health behaviors and outcomes identified behaviors that can either work to improve health outcomes or put someone at increased risk for disease. Behaviors are an important factor to examine as they fall under a larger ability to control at the individual level, and certain behaviors such as healthy eating and exercise are known to be more commonly associated with positive health outcomes.[39] Health outcomes relate to those factors that impact the length and quality of life for community members. Eight subthemes of behavior and outcomes were identified and are presented in order from most to least discussed:

- prevention
- exercise
- self-advocacy
- unmet mental health needs

> "[…] If we could actually bring more of that to the classroom, bring this type of [health] education to students, I think that that would be helpful. More health-related stuff, more mental health-related stuff, physical and mental, building that into curriculums, versus relying on a health class, just one thing that not all students have to take but should. I think that would be helpful."
>
> - *General Population Focus Group*

[39] CDC, Healthy Weight 2023

- substance use
- poor nutrition
- obesity
- chronic disease

Some participants in key informant interviews shared that substance use impacts unhoused populations. They noted that individuals use substances in public locations because there is a lack of treatment centers. Others discussed preventive education as a means of reducing health issues, with a focus on younger communities. Several key informants described a number of challenges and barriers related to mental health needs, as well as a number of issues related to resources, with a lack of service options and providers being the resource issue that was most described. Five participants also described a lack of funding in Maricopa County to ensure that spaces are navigable, accessible, and culturally aware. Key informants also discussed food deserts as a barrier for accessing nutritious food options. One innovative suggestion was that insurance coverage should include services like transportation to food banks.

> "Maricopa County did a really good job, especially during the pandemic, with really hearing the voices of the community…it was really community-driven, and I think that was really great. Our County Public Health Department is really focused on these upstream approaches to improving population and community health. And that often means engaging in advocacy and public policy and leveraging their voice is really critical because even though there has been some corrosion of trust with public health and things like vaccines and immunizations, they are still trusted community members."
>
> - – *Key Informant*

Health Behaviors and Outcomes Subthemes:

Prevention

Exercise, Poor Nutrition, Obesity, Diabetes, Cancer, Chronic Disease

Self-Advocacy

Unmet Mental Health Needs and Substance Use

Health in Arizona Policy Initiative (HAPI) and Chronic Diseases

The Health in Arizona Policy Initiative (HAPI) is an approach that aims to address population health needs by including health in all government and state policies. Multiple counties across Arizona participate in HAPI through the Arizona Department of Health Services to collaborate and enhance large-scale approaches to health. It is based on the idea that health is impacted not only by individual choices and factors, but by the interaction of various domains, including environment and local or statewide government policies.

This area focuses on what prevalent chronic diseases (diseases lasting more than one year) were commonly reported by focus group participants. The HAPI component of the focus group questions was added during the time that the focus groups were already being conducted. For this reason, there were no questions phrased specifically to elicit responses from the community directly related to prevalent chronic diseases. Despite this limitation, several subthemes emerged. Participants reported what diseases they personally had experienced and what they perceived to be more prevalent in their communities. Three subthemes of prevalent chronic diseases were identified and are presented from most to least discussed:

- mental illness
- diabetes
- cancer

> "I haven't mentioned skin cancer, which is on the rise and a real problem. Especially for people who are living alone or are unhoused, and they can't see, or they can't get to – they can't see the cancer, they can't get to care."
>
> - *Religious Minority Focus Group*

Participants in key informant interviews noted that stigma is a barrier for those with mental illness to receive treatment. Older adults are more likely to have mental health diagnoses that are overlooked, which leads to a lack of funding for specific populations in Maricopa County. One participant also shared a concern that anxiety is often underdiagnosed, and another expressed wishes for the development of treatments for diagnoses such as Alzheimer's. Some key informants noted the relationship between the lack of healthy outdoor space with health issues, such as cancer.

> "On Navajo [land], we are located on areas [that include] uranium, so there's a huge increase in cancer."
>
> - *Key Informant*

Additional Topics

The theme "additional topics" was included to capture topics that did not align with other themes but were notable topics of conversation. These topics of conversations were categorized into two subthemes. The two subthemes are in order from most to least discussed:

- innovation
- trust

> "For a similar idea, I suggested if there is a kinda of call center concerning our concerns about health issue, it'll be very helpful because in South Korea, if we put 119, Korean version of 911, we can ask a doctor real-time, 24 hours all the time about our issues, so there should be no debate. Like, "My son has a fever." I say something. My wife say something, but we all stay silent because doctor can say the answer."
>
> - *Asian Focus Group*

Participants in key informant interviews discussed trust in the context of immigrant communities and communities of color, particularly due to the anti-immigrant sentiment and complex trauma experienced by immigrants and in relations with law enforcement, which can contribute to self-isolation. Innovation was mentioned in key informant interviews in relation to Arizona State University, which focuses on research as well as the region's innovation and economic development.

> "There's plenty of research that backs up how the more anti-immigrant sentiment, the more isolated and the higher levels of PTSD and complex trauma people experience...even when we're bringing resources, people question why are we providing resources?"
>
> - *Key Informant*

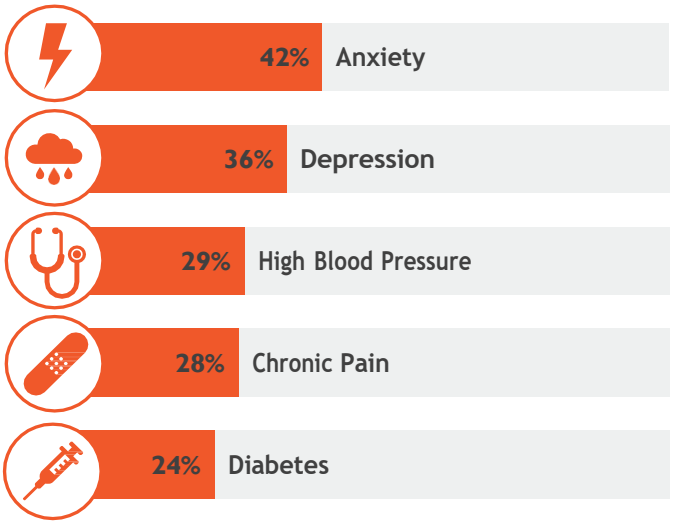
Survey Findings

Southeast Region Community Health Survey

About the Survey: *4,805 Southeast Maricopa County Region residents completed the survey during March – June 2023. Some survey questions were not completed by all survey participants, and the results might not reflect the opinions of the total Southeast Region population. Visit maricopahealthmatters.org to view all responses.*

Which health issues have the most impact on you and/or the people you live with or care for?

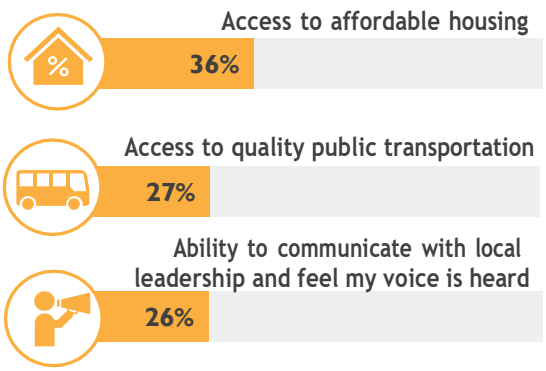
Many people said **anxiety, depression,** or **high blood pressure** were the health issues that have the most impact on someone they care for, live with, or themselves.



How would you rate these assets in your community?

The community assets most likely to be rated as poor included **affordable housing** and **public transportation**.

The highest rated community assets included **access to parks** and **feeling safe at home**.



How would you rate your physical and mental health?

Overall, few people reported poor personal health. However, certain groups rated their health as **poor** more often:

Poor Mental Health

11%	Overall
28%	Unhoused
26%	LGBTQ+
24%	Disabled

Poor Physical Health

7%	Overall
28%	Disabled
24%	Unhoused
17%	Income less than $15k

How often could you get health care when needed?

Many people shared they had difficulty getting health care. Certain groups had even **more difficulty** getting needed care:

Difficulty Getting Mental Health Care

Overall	55%
Native Hawaiian or Pacific Islander	81%
Refugee, Immigrant, Migrant	74%
Unhoused	73%

Difficulty Getting Medical Care

Overall	35%
Native Hawaiian or Pacific Islander	69%
Unhoused	65%
Refugee, Immigrant, Migrant	52%

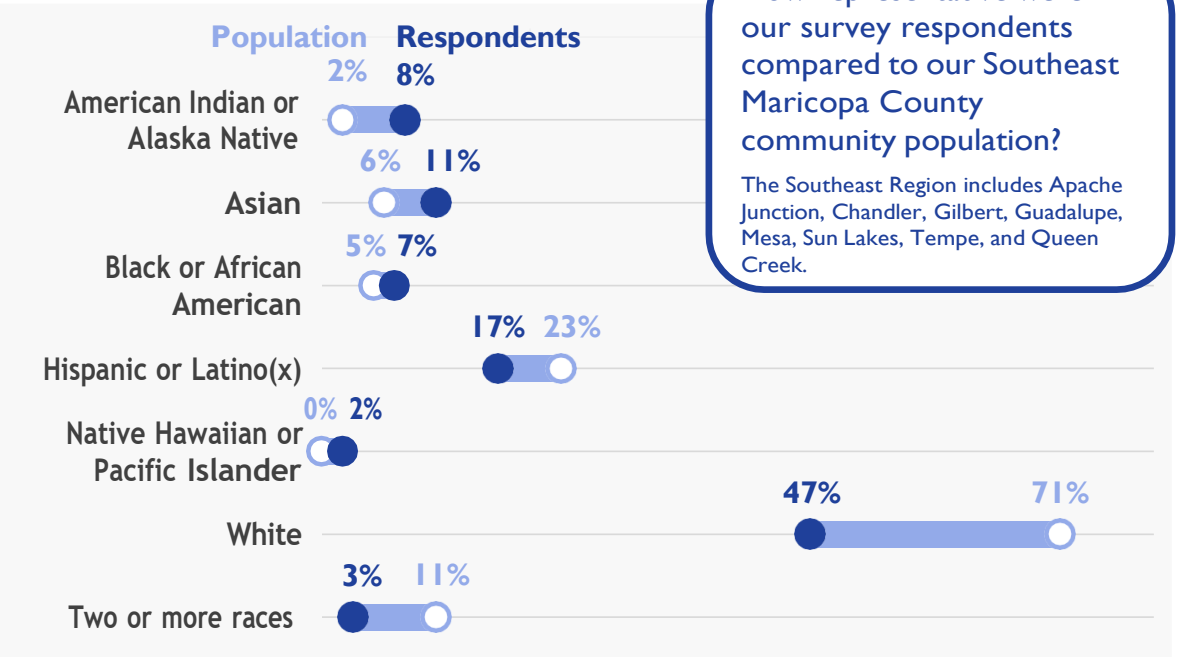
What would help you get the care you need?

- **45%** Evening or weekend appointments
- **45%** Lower out of pocket cost for services
- **38%** Multiple services at the same location

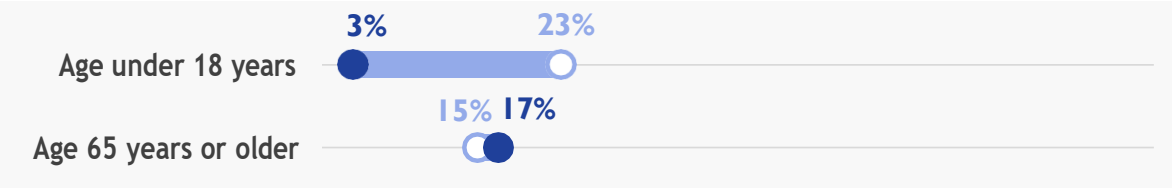
Community partners helped us achieve our largest and most inclusive survey yet.

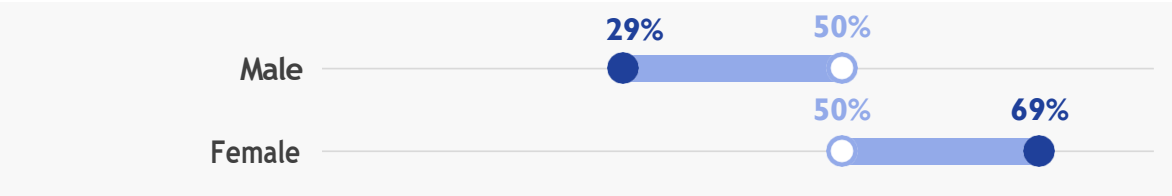
How representative were our survey respondents compared to our Southeast Maricopa County community population?

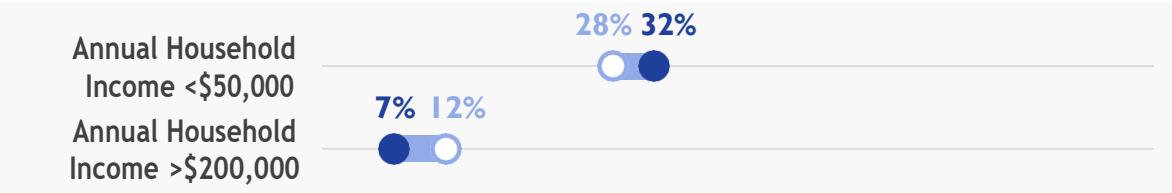
The Southeast Region includes Apache Junction, Chandler, Gilbert, Guadalupe, Mesa, Sun Lakes, Tempe, and Queen Creek.



Respondents selected the race / ethnicity they identified with most; Population race / ethnicity aligns with the 2022 American Community Survey







Sources: *2023 Maricopa County Community Health Survey, 2022 American Community Survey*

Prioritized Needs

Prioritization Process

The needs prioritization process is a critical step in finalizing the Community Health Needs Assessment. A prioritization session was conducted on July 31, 2025, with 10 BGMC leaders. This was a 60-minute session facilitated by Banner staff. The meeting consisted of a data presentation, discussion of the data, community needs, and potential strategies.

An initial 18 health indicators were identified through primary and secondary data collection. Utilizing the Hanlon Method for setting criteria and ranking, 3 health indicators were identified to prioritize as significant health needs.

The Hanlon Method objectively takes into consideration explicitly defined criteria and feasibility factors, utilizing the formula:

$(A+2B)\times C$

Criteria for the Hanlon Method is listed below.

A. Size of the Problem
B. Seriousness of the Problem
C. Effectiveness of the Problem

During the roundtable discussions, topics included the magnitude and severity of the community need, potential barriers to addressing the needs, and what happens if the community need is not addressed in the hospital's service area. Following discussions, all participants were asked to rank each of the community needs on a scale for magnitude, severity, and feasibility. Using the Hanlon Method formula, a priority score was assigned to each community need. The results were provided to each local health system for consideration as they build their hospital Implementation Strategy. See Appendix E for the Needs Prioritization PowerPoint presentation.

Top Community Needs

The following community needs were prioritized as a result of the prioritization process:

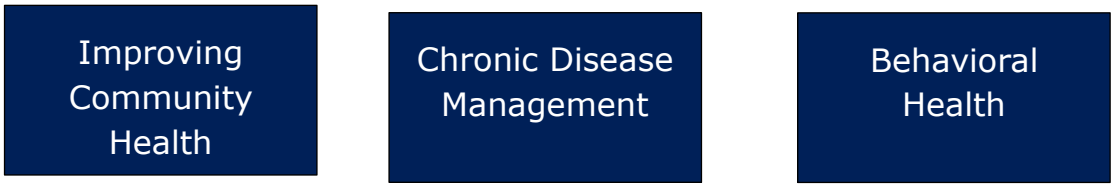
Exhibit 28: Top Community Needs

Rank	Community Need
1	Access to Mental and Behavioral Health Services
2	Cancer Prevention and Treatment
3	Obesity and Nutrition
4	Health Insurance
5	Access to Specialty Care
6	Child and Adolescent Health
7	Access to Primary Care
8	Maternal and Infant Health
9	Mental and Behavioral Health Conditions
10	Diabetes
11	Cardiovascular Disease
12	Substance Use
13	Discrimination / Racism / Oppression
14	Environmental Health & Heat
15	Access to Healthy Food
16	Housing and Homelessness
17	Mortality from Unintentional Injury
18	Education Access and Quality

Appendix A: 2022-2025 Implementation Strategy Update

The Community Health Needs Assessment process should be viewed as a three-year cycle to evaluate the impact of actions taken to address priority areas. This step affirms organizations' focus and targets efforts during the next CHNA cycle.

The top three health priorities for BGMC from the 2022 Community Health Needs Assessment were:



Summary of Progress to Date

Significant Health Need: Improving the health of the communities we serve
Strategy: Increased utilization of Banner Health's care continuum through our clinics, hospitals, ambulatory settings, and post-acute settings of care.
Anticipated Outcome: Improve our communities' ease and access to the care continuum for all their health care needs.
• *Growth in utilization of ambulatory services, such as urgent care access, ambulatory surgical centers, and clinic access.* • *Improvement to online scheduling ease and navigation of Banner Health patient portal – this includes links to pre-approval text messages and communication via texting prior to the appointment.*
Strategy: Supporting our team members through internal wellness programs and employee benefits.
Anticipated Outcome: Inspire a healthy and productive work force.
• *Provide programs to medical staff to reduce burnout. Programs include Wellness in Nursing and Clinical Happiness in Medicine for physicians and advanced practice providers. This has resulted in year-over-year improvement in clinical providers' reduced burnout.* • *Improve Banner Health team member engagement and employee satisfaction via facility-led initiatives – annual survey data shows a 15% increase in employee satisfaction over a three-year trend.* • *Support employee wellness through well-being programs both in-person and virtual, focusing on physical, mental, and financial health.*
Strategy: Align Banner Health's strategies and processes with Social Determinants of Health practices.
Anticipated Outcome: Educate Banner Health team members and partners on incorporating Social Determinants of Health into our health care strategies.
• *Continue to identify areas of opportunity via community partnerships to address social determinants of health.* • *Provide care to over 1,500 annually via in-school clinics and mobile health clinics to low-income pediatric patients.* • *Provide ~1,300 vaccines to pediatric patients annually via in-school clinics and mobile health clinics to low-income patients.* • *Support seniors via food deliveries (~200 households annually), advocacy programs (~1,500 interactions annually), and grief support programs.*

Significant Health Need: Chronic Disease Management
Strategy: Increase access to Primary Care.
Anticipated Outcome: Improve ease of primary care utilization.
• *Improve year-over-year utilization of online scheduling for primary care visits by 2.5%* • *Utilization of ~10k annual telehealth visits to monitor chronic care conditions for patients.* • *Provide external resources to patients to support the management of health.*
Strategy: Support Banner Health communities in managing chronic diseases.
Anticipated Outcome: Improve chronic disease management through clinical support and patient education.
• *Improve patient management of high blood pressure, via primary care interventions and monitoring by 10% from 2022 to 2025.* • *Help patients monitor HbA1c levels with a target to below 16% for primary care visits – by 2025, facilities averaged 16%, a 4% decrease since 2022.*
Strategy: Increase awareness of and access to cancer screenings. **Increase awareness of and access to cancer screenings.**
Anticipated Outcome: Increase preventative cancer care.
• *Provide educational materials and resources to community members and patients for cancer awareness and prevention.* • *Increase patient compliance for routine colon screenings from 2022 to 2025, with a goal of 75% of patients being compliant (2025 half year at 79%).* • *Increase patient compliance for routine breast cancer screenings from 2022 to 2025, with a goal of 75% of patients being compliant (2025 half-year at 66%).*

Significant Health Need: Behavioral Health
Strategy: Provide awareness and access to mental health resources.
Anticipated Outcome: Reduce volume of acute mental health episodes through early interventions of education and access to preventative care.
• *Provide virtual education opportunities for mental health education and awareness of internal and external use.* • *Utilizing tele-behavioral services to provide resources to behavioral patients – growing from ~50 assessments annually to ~400 annually from 2022 to 2025.* • *Provide quick and easy access to Banner Health mental health resources for clinicians to share with patients.*
Strategy: Support communities in accessing substance prevention and intervention services.
Anticipated Outcome: Improve utilization of prevention and intervention services for substance use.
• *Utilize intervention best practices for addressing substance abuse and misuse, focusing on program utilization in clinics, emergency departments, and urgent cares.* • *Provide multi-interventional tobacco cessation support in all facilities for patients and their families.* • *Continue to provide inpatient detox and intensive outpatient services at all Banner Health acute health sites.*

Summary of Community Feedback

Banner Health welcomes community input and feedback on our Community Health Needs Assessment and our Implementation Plan. The public is invited to contact us on the Community Benefits webpage.

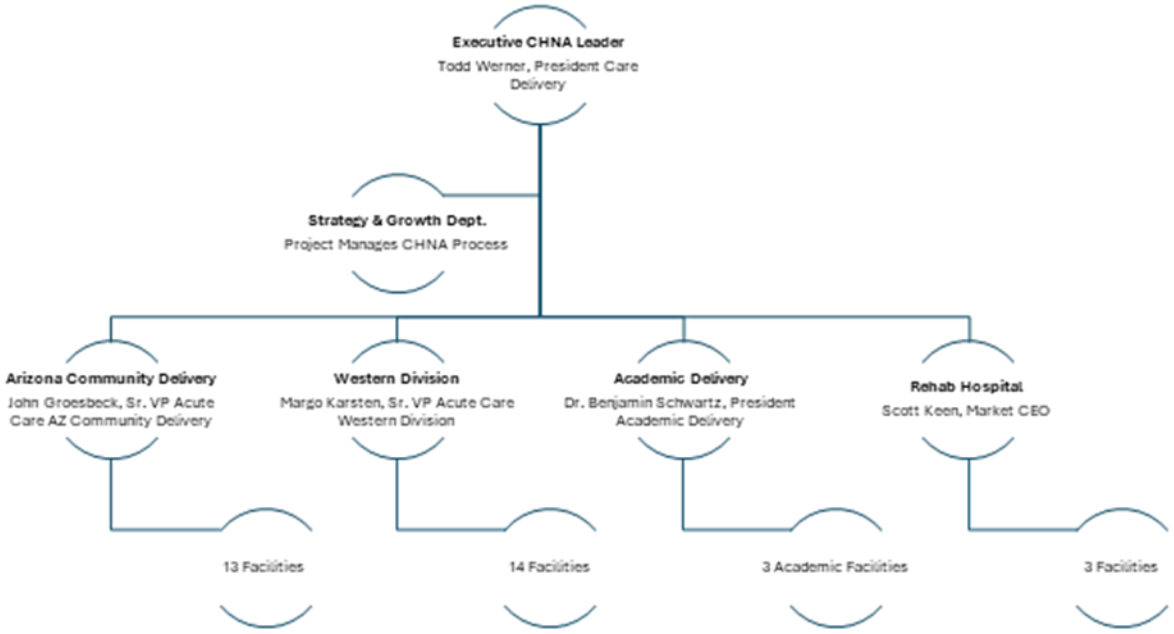
Since 2022, we have received a variety of communication via our Community Benefits webpage. Banner Health tracks comments received and addressed all comments where able. The table below is a summary of the themes of comments collected from 2023 to half year 2025.

To organize questions submitted, Banner Health utilizes a program called Form Stack to track feedback from community members. Banner Health CHNA Team Members routinely check the Form Stack account to be sure that all questions submitted to Banner Health are addressed in a timely manner.

	Feedback from Community
2023	• Comments on opportunities to align on the Behavioral Health strategies tactics. • Requests for recordings and notes from Colorado facilities annual Hospital Community Benefit Accountability Program. • Solicitation to participate in community collaboratives that align with Banner Health Implementation Plan.
2024	• Invitation to participate in local Community Health Fair. • Updates on changes to partner county org structure for CHIP and CHA work. • Solicitation to participate in community collaboratives that align with Banner Health Implementation Plan. • Request to participate in focus groups to understand alignment of Banner Health CHNA with city and county community health work.
Half Year 2025	• Questions, RSVPs, and follow ups to the CHNA Community Forums, Key Informant Interviews, Focus Groups, and Surveys. • Requests for recordings and notes from Colorado facilities annual Hospital Community Benefit Accountability Program. • Requests to understand the timeline on the 2025 CHNA Reports.

Appendix B: CHNA Organizational Structure

Banner CHNA Steering Committee



CHNA Facility-based Champions

Facility Leaders	Champion(s) -- 2025
Darren McCollem, CEO	Pamela Ballard (Director, Clinic Administration)

Synapse Partners

CHNA Collaborators

Banner Health partners with Maricopa County Department of Public Health to conduct this CHNA, which was developed by Maricopa County Department of Public Health. Another key CHNA collaborator is Synapse, a coalition of non-profit and federally qualified health care providers that work together to collect data and conduct CHNAs to guide community investments. The following organizations are a part of the Synapse Coalition:

- Adelante Healthcare
- Banner Health
- City of Hope
- Circle the City
- Dignity Health
- Mayo Clinic
- Native Health
- Neighborhood Outreach Access to Health (NOAH)
- Phoenix Children's
- Valleywise Health
- Vitalyst Health Foundation

Assessment, Process, and Methods

Maricopa County health centers and hospitals play a vital role in enhancing the region's health and economy. Beyond providing high-quality medical care, these institutions implement programs that address community-specific needs. Many healthcare partners serve overlapping populations, leading to collaboration across Maricopa County. As a result, organizations such as Adelante Healthcare, Banner Health, City of Hope, Circle the City, Dignity Health, Mayo Clinic, Native Health, Neighborhood Outreach Access to Health, Phoenix Children's, and Valleywise Health partner with Maricopa County Department of Public Health through the Synapse Coalition to identify community strengths and address the most pressing needs through a coordinated CHNA.

Appendix C: Engagement

Sample Selection. Purposive sampling was used to recruit participants which involves the attraction and selection of individuals who meet certain inclusion criteria and do not meet certain exclusion criteria. Diversity in age, gender, race/ethnicity, physical ability, and other background factors were emphasized in recruitment. Inclusion criteria consisted of living in Maricopa County for at least six months of the year and meeting the criteria for the target population for that group. Target populations were recruited according to the priority populations identified by MCDPH and the Synapse partners. The 17 target populations included the following:

- Asian
- Black/African American
- Hispanic
- Native American
- Native Hawaiian/Pacific Islander
- Youth Ages 12-17 Years
- Seniors 65 Years and Older
- Low Income Individuals
- Religious Minorities
- Unsheltered
- Disabled
- Veterans
- LGBTQ+
- Refugee, Immigrant/Migrant
- Formerly Incarcerated
- People Living in Rural areas of Maricopa County

However, no specific groups were held with only Native Hawaiian/Pacific Islanders or disabled persons. Further, several focus groups were not of a specific priority population and were categorized as general population, allowing individuals from various backgrounds to participate at one time. Some individuals met the criteria of several priority populations. For example, one focus group was conducted with persons who identified as both low income persons and as seniors, and in another group, individuals identified as both low income and formerly incarcerated.

Geographic Region. Recently, MCDPH divided the county into five regions (Central Phoenix, Northeast, Northwest, Southeast, and Southwest) to help prioritize needs and resources in specific areas as Maricopa County is one of the fastest growing counties in the country. Participants were recruited from each of the five regions, and some focus groups were held which were not in a specific region and were thus

categorized as countywide, allowing individuals to participate from various regions at one time. The 46 focus groups were conducted across the regions as follows: Northeast (n=4), Southeast (n=6), Central Phoenix (n=12), Northwest (n=6), Southwest (n=5), and Countywide (n=13).

Recruitment. Marketing efforts included English and Spanish flyers (see Appendix J), social media posts (e.g. Facebook) and word of mouth by SIRC evaluators and partners. Recruitment materials were distributed by SIRC evaluators and partners across Maricopa County. Flyers were specifically tailored to the populations of interest and posted in some local businesses and organizations of community partners. Efforts were made to recruit through a wide range of networks and associations for each group with the assistance of MCDPH and its partners.

Registration. Prior to registration, interested individuals were screened to ensure they met the qualifying criteria using a set of questions developed. Participants were able to register for the groups via phone, email, paper sign-up sheets, or online through an online survey questionnaire platform. After registering for a focus group session, potential participants were sent reminders and a confirmation email that included logistical information such as time, date, and directions prior to their focus group. They were also asked to complete an online survey prior to attending the focus group (see Appendix O). Each participant was contacted by phone the day before the group to confirm participation, to clarify any logistical questions, and to minimize attrition.

Venues. SIRC worked with new and existing community partners to identify and reserve appropriate locations for focus groups. All but one community partner volunteered their space. Those who volunteered their space were given a $45 Walmart gift card as a thank you for using their space. Venues selected were ADA compliant, convenient to the targeted participants, and located along public transportation routes to further minimize barriers to participation among the populations of interest. Venues were selected to ensure sufficient reach throughout Maricopa County. SIRC's Zoom platform was used for all virtual focus groups.

Participants. The target number of participants for Zoom focus groups was four to six individuals and six to 12 individuals for in person groups. Each group lasted approximately 90 minutes which was sufficient time for high quality data collection from the discussion while remaining respectful of participants' time. Most participants were 18 years of age or older, except in the groups in which youth participated; youth groups include persons as young as 12 years of age. A total of 397 individuals registered for a focus group; however, not all attended, which resulted in a total of 366 individuals participating in the focus groups. Participants had the options of signing up for an in person or Zoom focus group; 19 focus groups were conducted via Zoom and 27 in person.

Incentives and Supervision of Children. Individuals who participated in a focus group via Zoom received a $45 Tango e-card as a stipend. The Tango e-card was redeemable with over 500 vendors. Individuals who participated in person received a $45 Walmart gift card and in some cases were given the option to receive a Tango e-card instead. Additionally, individuals participating at the in person focus groups were also provided with a light meal and healthy beverages. The $45 incentive was deemed ethical as it was sufficient to achieve participation without being coercive (Grant and Sugarman, 2004). To minimize barriers to participation, supervision of children was provided as needed for each in person focus group by SIRC staff. Child supervision was conducted by a SIRC evaluator with an active Fingerprint Clearance card.

Consent. Per IRB requirements, participants were fully informed of any risks, benefits, and expectations associated with their participation. They were asked to sign an IRB-approved consent form prior to participating in the focus group. The signed consent forms were stored separately from any personal data provided by the focus group participants. Figure 1 shows a visual display of the focus group process.

Interview Guide

Introduction (5 minutes)

The Maricopa County Department of Public Health (the department) aims to better understand the health and well-being of Maricopa County community regions, service providers, and individual residents to determine priority health areas and barriers across Maricopa County. MCDPH has partnered with OMNI Institute, a non-profit social sciences consultancy, to conduct a qualitative assessment as part of a larger Community Health Needs Assessment (CHNA). Your feedback will be integrated into a larger CHNA report and will help to determine health priorities and design interventions for inclusion in a Community Health Improvement Plan (CHIP).

We are conducting 24 key informant interviews as part of this qualitative assessment. You have been invited to participate in this interview due to your key perspective on community strengths, challenges, and needs. The interview will take approximately 60 to 90 minutes, depending on your responses.

In our 1:1 interview, I'll ask around:

Your background/role: Your name, your organizational role/position, and what you do in the community.

Community strengths and assets: What strengths and resources there are in your community that support health and well-being.

Built environment: What physical and cultural assets are in the built environment in your community, how those may vary by neighborhood, and

Forces of change: What the current and historical forces of change are locally, regionally, and globally that have shaped the political, economic, and social conditions of the community.

Go Over Participant Rights (5 minutes)

Before we begin, I'd like to review a few things about your participation.

Participation in today's interview is completely **voluntary.** This means you do not have to answer any questions you feel uncomfortable answering, and you are free to leave anytime. There will be no penalty or consequence if you choose not to answer a question or participate in this discussion. You can also ask me any questions that you may have.

In terms of **privacy**, although your name will not be used, please be aware that information on the community sector in which you work, along with a summary of key informant findings will be provided to the public. Also understand that your identifying information including your name, organization, and title will be removed

from the transcript file when all transcripts are shared with MCDPH staff ONLY at the end of this project. However, because of your organizational/community role, there is a high risk or likelihood that you may be identifiable in the transcript. Finally, please know that the results of the study may be used in reports, presentations, or publications.

- Do you understand the purpose of the interview and give your consent to participate?

Lastly, I would like to record our interview. This allows me to focus on the conversation while making sure we capture your comments. No one outside of the OMNI evaluation team will hear the recording.

- Do you consent to be audio recorded?

********** *(START RECORDING)*********

Introduction (5 minutes)

1. First, can you please tell me your name and briefly introduce yourself?
    a. Probes: What is your job title and what do you do at your organization? How long have you been doing this work?
    b. What geographic regions do you serve?
        i. E.g., All of Maricopa County, All of Arizona, Central (Phoenix), Northwest Valley Southwest Valley, Northeast Valley, Southeast Valley, Rural West Maricopa County, Rural East Maricopa County, Native American Reservation
    c. What populations do you serve?
        i. E.g., Adults with Special Health Care Needs, African American / Black American, Indian / Native American, Asian / Pacific Islander, Children with Special Health Care Needs, Hispanic / Latinx, Homeless / Housing, Insecure Immigrants / Migrants, LGBTQ, Older Adults / Seniors, Recently Incarcerated Refugees / Asylum Seekers, Veterans, Other, All of the Above
    d. What age group(s) do you serve?
        i. E.g., Children (0-5), Children (6-11), Adolescents (12-17), Adolescents / Young Adult (18-24), Adults (25-34), Adults (35-64), Seniors (65-74), Seniors (75+), All Age Groups

Community Strengths and Assets (15 minutes)

Community strengths and assets are key resources (including community members) that are utilized to improve community health. Strengths can include skills, education, job experience, and community organizing as well as qualities not

typically considered valuable but which contribute greatly to community health such as resilience and local knowledge.

2. What strengths and assets do community members have?
    a. Probe: What resources and capabilities do individuals within the community possess that contribute to its well-being?
3. How do these community strengths and assets support/aid community health?
    a. Probe: Lift up examples from the previous response (for clarity as necessary)
4. Which strengths and assets can be used and strengthened to address health inequities?
    a. Probe: Are there any untapped resources within the community that could be mobilized to address specific health disparities?
5. [As time allows] What organizations and agencies are addressing [insert the sector(s)] needs in Maricopa County?
    a. Probes: What services do each provide? What more can they do to meet Maricopa County's needs, if anything?

Built Environment (15-20 minutes)

For this section, built environment is defined as the human-made surroundings that influence overall community health, including the individual behaviors that drive, promote, and/or hinder health and wellness.

6. What physical assets and resources exist in the built environment of your community around [insert relevant sector(s) of interest]?
    a. Probes: Infrastructure (roads, bridges, bike lanes, pedestrian pathways); public facilities (schools, hospitals, community centers, libraries); housing (affordable housing, homeless shelters and services); green spaces (parks, playgrounds, gardens); safety and security (policy, emergency services), cultural and historical assets (museums), etc.
    b. [As needed] How do community members view and interact with their built environment? How do these interactions impact community members' health?
7. How do these resources differ across neighborhoods, particularly in those experiencing the greatest health disparities?
    a. Reframe: Health inequities are focused on SDOH based caused by structural factors that affect some groups more than other (e.g., how do neighborhood resources differ by SES, racial/ethnic groupings, geographical location, etc.)

8. What barriers prevent community members from experiencing their built environment fully?
    a. Probe around accessibility (e.g., wheelchair accessibility), the physical design of the community (e.g., is there a highway cutting through certain neighborhoods?), etc.
9. What key aspects of the built environment in your community affect health inequities?
    a. Probe: How do they impact community health inequities? How can those aspects be improved or addressed to improve community health?

Forces of Change (15 minutes)

Forces of Change are defined as forces that can affect the community and local public health system. It can focus on occurrences in the past, present, or future, including forces in the past that contribute to structural inequities.

10. What is occurring or might occur that affects the health of your community or local public health system? (These can be both things within your community and things in the larger societal and economic context of your community.)
11. Which communities are disproportionately impacted by forces of change? How and why are they disproportionately impacted?
12. What is the local health department's role in addressing community health and wellness?
13. How have climate change and/or COVID-19 changed conditions in your community?
14. What forces can reinforce health equity in our community now and in the future? How can we take advantage of these forces?

Summary Question (2-5 minutes)

15. [As time allows] Is there anything else that you would like to share that you think is important and I haven't asked you about?

Focus Group Guide

Discussion Guide

Facilitator reads:

The goal of this focus group is to better understand the health and wellbeing of Maricopa County community regions, service providers, and individual residents to determine priority health areas and barriers across Maricopa County.

Opening Question (5 minutes)

To begin, why don't we go around the room and say one thing you like about your community.

General Quality of Life/ Community Questions (XX minutes)

I want to begin our discussion today with a few questions about quality of life and health in your community.

1. What does quality of life mean to you?

   Prompt: How has your quality of life changed in the last year?

   Prompt: What would help improve your quality of life?

2. Take a moment to picture a healthy community. [Pause for reflection] Describe your picture of a healthy community.

   Prompt: How does your actual community compare with what you have described?

   Prompt: What is most important to you when it comes to living a healthy life?

3. In what ways does your community positively affect your health and others around you?

   Prompt: In what ways does your community negatively affect your health and the health of others around you?

Community Health Needs and Concerns (XX minutes)

Next, let's discuss any specific strengths, needs, and concerns about your community

4. When thinking about health, what are the greatest strengths in your community?
   Prompt: What is going well in your community?

5. What are the most common health problems affecting you and the people in your community?

   Prompt: Which of these health problems do you consider to be the most significant? Please explain.

6. What are the barriers to improving the health of your community?

   Prompt: How are these barriers affecting the health you and people close to you?

   Prompt: What is needed to remedy these health problems?

Access to Services, Information and Resources (XX minutes)

In this section, we will discuss access to health services, information, and resources.

Subsection: Health Services

We will first discuss access to services such as seeing a doctor, getting annual exams, getting prescription medication, and getting mental health services.

7. Take a moment to reflect back upon the last year. Was there a time when you (or someone close to you) had difficulty accessing needed health service(s)?

   Prompt: What, if anything, would have improved access to these needed resources?

8. Have you or others in your community experienced barriers to getting medical or physical health care, such as access to health providers, medications, and services? If so, what are those barriers?

9. Have you or others in your community experienced barriers to getting mental health care, such as treatment or support? If so, what are those barriers?

10. Are there any cost issues that keep you from caring for your health? (such as co-pays or high-deductible insurance plans)

    Prompt: If you are uninsured, what would help you get insurance?

11. To what degree, if at all, have you experienced or noticed any healthcare-related discrimination based on your identity (e.g. race, gender, income, education, disability, sexual orientation, etc. -depending on group)

    Prompt: If you do not regularly seek care, are there provider concerns that keep you from caring for your health?

    Prompt – ask if there are concerns about providers not identifying with them.

Subsection: Health Information

Now we'll talk about access to health information and resources, such as information about where and how to get care, information about how to stay healthy or treat a health condition, and instructions from a care provider.

12. Where do you typically go to get health related material?

    Prompt: Which health related information and resources are most accessible to you and your community?

    Prompt: Do you consider these sources to be trusted and reliable?

13. How can health information and resources better reflect your culture and identities?
    Prompt: Do you feel heard or understood by your healthcare provider/s?

    Prompt: Do you understand what your healthcare provider tells you?

14. Can you think of anything else that may pose a barrier to accessing healthcare services, information or resources in your community?

Community Health Recommendations (XX minutes)

As the experts in your community, I would like to spend this final part of the focus group discussion talking about what is working in your community and your ideas to improve community health.

15. What are some ideas you have to help your community get or stay healthy and thrive?
    Prompt: What else do you and those close to you need to maintain or improve your health?
    [Additional prompts – ask this if it does not come up naturally]
    i. Services, support or information to manage a chronic condition or change health behaviors such as smoking, eating habits, physical activity, or substance use
    ii. Preventative services such as flu shots, screenings or immunizations
    iii. Specialty healthcare services or providers (such as heart doctors or dermatologists)

16. Are there other services or resources (not already mentioned) that you and others need that aren't in your community?

Ending Question (X minutes)

17. Is there anything else related to the topics we discussed today that you think I should know that I didn't ask or that you have not yet shared?

Facilitator Summary & Closing Comments (X minutes)

Let's take a few minutes to reflect on responses you provided today. We will review the notes we took and the themes we observed. This is your opportunity to clarify your thoughts or to provide alternative responses.

[Co-facilitator provides a brief summary of responses for each of the questions or asks clarifying questions if she thinks she may have missed something.]

Thank you for your participation in this focus group meeting. You have all raised a number of great issues for us to consider. We will look at what you have told us and use this information to make recommendations to area hospitals and the Maricopa County Department of Public Health.

[Turn off recording devices.]

Gift Cards (X minutes)

Ensure we have the participants' correct email address for distribution Explain gift cards will be sent within the next 72 hours

Appendix D: Community Survey

Exhibit 30: Survey Questions

Maricopa County 2023 Community Health Assessment

In this survey, we want to hear your opinions and experiences related to your health and wellness. Your answers, alongside others', will shape community improvement goals and funding. No personally identifiable information will be collected, and all responses will be kept confidential. This survey is for residents of Maricopa County age 12 and above. Thank you for participating in this survey and supporting your community. If you have questions about the survey or need an alternative format, please email MaricopaHealthMatters@maricopa.gov.

This survey is for people who live in Maricopa County at least six months out of the year.

1. What Maricopa County zip code do you live in? _____

2. What city or town do you live in? _____

3. Please rate your health *(For each, choose only one)*:

3a. How would you rate your physical health, such as how your body feels day to day?	☐ Very Good	☐ Fair	☐ Poor	☐ Prefer not to answer

Tools for Prioritization: Method & Metrics

Banner Health

The 18 Health Indicators

Access to Care	Behavioral Health	Chronic Disease Management	Other
• Access to Primary Care • Child and Adolescent Health • Health Insurance • Maternal and Infant Health • Mortality from Unintentional Injury • Access to Specialty Care	• Access to Mental and Behavioral Health Services • Mental and Behavioral Health Conditions • Substance Use	• Access to Healthy Food • Cancer Prevention and Treatment • Cardiovascular Disease • Diabetes • Obesity and Nutrition	• Discrimination, Racism, Oppression • Education Access and Quality • Environmental Health and Heat • Housing and Homelessness

Indicator list is based upon County Health Assessment process and grouped by themes

Banner Health

Banner Health

How the Scoring Works

Hanlon Method: objectively takes into consideration explicitly defined criteria and feasibility factors

$$(A + 2B) \times C$$

A = Size of Health Problem

% of Population Impacted

Based on data collected from the community (Census or community survey, State discharge data, etc.)

B = Seriousness of Health Problem

Does it require immediate attention?

Is there a public demand?

What is the economic impact?

What is the quality-of-life impact?

C = Effectiveness of Intervention

Highest weighted criteria

Is this an indicator that can be addressed by a Banner Health facility?

Banner Health

Top Scoring Indicators

Your survey results

		A = Size of Health Problem	B = Seriousness of Health Problem	C = Effectiveness of Intervention	Total Score
1	Access to Mental and Behavioral Health Services	3.8	3.7	3.6	**39.5**
2	Cancer Prevention and Treatment	2.2	2.7	4.3	**32.7**
3	Obesity and Nutrition	2.9	3.1	3.4	**31.4**
4	Health Insurance	2.6	3.2	3.2	**29.0**
5	Access to Specialty Care	2.3	2.8	3.7	**28.9**
*	Child and Adolescent Health	2.9	2.6	3.4	**27.6**
*	Access to Primary Care	2.3	2.1	4.0	**26.2**

Are we missing any health indicators?

Banner Health

PART 3

Determining our Health Priorities

Banner Health

Your Turn: Choose Your Top 3

In the following slides, we will review each of the Top 5 health indicators along with the supporting data.

At the end of the presentation, you'll be asked to rank your top three health indicators in order of priority.

Banner Health

Access to Mental and Behavioral Health Care

Ranked: #1

Maricopa has seen a significant decrease in the ratio of population to mental health providers from 2018-2024, suggesting better access to mental health care.

2023 CHNA Survey

Issues with most impact on you/people you care for?

1. Anxiety (42%)
2. Depression (36%)

22%
"Never" able to get mental health care

55%
Difficulty getting mental health care
