Banner Research Administration

In support of Banner Health's Nonprofit Mission to provide excellent patient care; Our mission is to ensure research is conducted ethically, safely, and efficiently.

Decision Support Tool/Guidance Document Quality Improvement vs. Research

If the activity involves patients, employees, and/or lab specimens (from human subjects), and the answer is yes/unsure to any of the following, project should be submitted for IRB review.		Yes/ Unsure	No
1.	Does it assign people or lab specimens to groups for simultaneous comparisons?		
2.	Is it being conducted in hopes of contributing to generalizable knowledge in the area of study (and not for the sole purpose of improving Banner processes)?		
3.	Is the initial intent to publish the research results? (Inquire also with the publishing entity for guidance on IRB review.)		
4.	Does it involve patient/subjects undergoing procedures that normally would not be done for their disease/problem (i.e. beyond routine care for patients or outside of routine for employees — their work day)?		
5.	Does it involve increased risk or burden to the participants (e.g. additional blood draws, fatigue, embarrassment, or giving personal information)?		
6.	Does it involve interactions or observations that do not routinely occur in patient care (for patients) or everyday life?		
7.	Does it involve releasing data, protected health information (PHI) or personal information to individuals/entities other than for regulatory/accreditation purposes?		

*This tool is revised with permission from Kimberly Woods-McCormick, PVHS IRB Manager and Poudre Valley Health System (12/15/08) and is for general guidance use only. If your project involves any of the activities above, contact your research director for further discussion and advisement.
